| This course describes the modeling and the control of biological, biomedical and drug delivery systems used in biomedical and pharmaceutical engineering. The control of biological and drug-delivery systems is critical to providing a long and healthy life to millions of people worldwide. In living systems, maintenance of homeostasis is credited to several mechanisms (positive and negative feedback loops). This course covers the basics of mathematical modeling and control of biological, chemical and pharmaceutical systems, in order that the students will be able at the end to design control-release devices, to control drug delivery rate, to design feedback controllers such as infusion control in vasoactive drugs, in gaze control systems, in insulin infusion and others. |                                                            |              |
| <b>GBM639</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>Control of Biological and Drug Delivery Systems Lab</b> | <b>1 cr.</b> |

| This laboratory describes the modeling and the control of biological, biomedical and drug delivery systems used in biomedical, chemical and pharmaceutical engineering. This course covers a set of models, pharmacy-kinetics, and a set of simulations and dynamic behaviors of typical plants, and feedback controller designs. This laboratory will be delivered in Matlab, Mathematica, LabVIEW, E-Health Kits and other software.                                                                                                                                                                                                                                                                                                                                                                    |                                                            |              |
| <b>GBM650</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>Hospital and Medical Equipment Planning</b>             | <b>3 cr.</b> |
| The course covers the basics of hospital and medical equipment planning. The different topics include: reading and designing maps, electro-mechanical legends, mapping and planning of the different hospital departments (Emergency, Operating Department, Intensive Care Unit, Medical Laboratory, Radiology, Anesthetic). Applied projects will be discussed and designed in an interactive classroom environment.                                                                                                                                                                                                                                                                                                                                                                                     |                                                            |              |

| This course deals with the following topics : it starts with flow sheet symbols and drawings, followed by the mass and energy balances for steady-state reacting and non-reacting systems; composition variables and mass and energy flow rates; material balances in non-reacting systems and in systems with one or more chemical reactions; degree of freedom analysis for non-reacting and reacting systems; enthalpy of chemical reaction, heats of formation, heat capacities, dew points and bubble points; and numerous examples with process flow sheets to illustrate each topic. The students will learn to draw a flow sheet and construct it to solve chemical balance equations around multi-unit systems, and then extend this to other units.                                             |                                                            |              |

| This course introduces the student to simple reactions used in the organic chemistry laboratory and to basic techniques that modern organic chemists routinely use. The student will also be trained in an appropriate way to write a scientific laboratory report                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                            |              |

| <b>Pre-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | (CHM212 Or CHE212) And MAT217                              |              |
| This course covers the following topics: real gas (intermolecular interactions, molecular collisions, the critical temperature, the real gas state's equation, gases liquefaction); the first principle of thermodynamics (definition of enthalpy, enthalpy of formation, enthalpy of chemical transformations); the second principle of thermodynamics (entropy, spontaneous transformation, the Gibbs energy, the equilibrium reactions); the equilibrium phase change (phase diagrams, properties of non-electrolytes, phase diagrams of mixtures); the chemical kinetics: integrated form of the rate law, reaction kinetic factors, determination of half-lives, temperature dependence of the rate constant..                                                                                       |                                                            |              |
| <b>GCH412</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>Chemical Engineering Thermodynamics</b>                 | <b>3 cr.</b> |
| <b>Pre-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | GCH355 and GMC340 and MAT227 and GCH410                    |              |
| This course deals with the following topics: phase diagrams of pure fluids, calculation of properties, VLE of pure fluids, the origin of chemical potential and fugacity, the properties of mixtures, fugacity and activity coefficients, the theory and applications of solution thermodynamics, phase behavior of mixture, theory of vapor-liquid equilibrium, ideal solution, non-ideal solution.                                                                                                                                                                                                                                                                                                                                                                                                      |                                                            |              |
| <b>GCH415</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>Applied Organic Chemistry</b>                           | <b>3 cr.</b> |
| <b>Pre-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | GCH310                                                     |              |

This course aims to study the structure, properties, and reactions of alcohols, ethers, aldehydes, ketones, carboxylic acid and their derivatives and amines, with emphasis on mechanistic and stereochemical aspects of organic reactions. This course surveys also the major sources of raw materials (coal, oil and petrochemistry); classification of oils; fractional distillation of petroleum; the olefins; oxidized derivatives of ethylene; benzene hydrocarbons; production and processing; synthetic polymers; and the detergents.

**GCH434** **Mass Transfer Operations** **3 cr.**  
**Pre-requisites** GMC451

The importance of Mass Transfer operations in chemical processes is insightful. There is scarcely any industrial process that does not require a preliminary purification of raw materials or final separation of products. This is the realm of mass transfer operations. The mass transfer operations are largely the responsibility of chemical engineers, but increasingly practitioners of other engineering disciplines are finding them necessary for their work. The objective of this course is to provide a means to teach undergraduate chemical engineering students the basic principles of mass transfer and to apply these principles to the design of equipment used in separation processes in a continuum of courses (Unit operation, Separation Methods ...). This course presents a detailed perspective of the fundamentals of mass transfer phenomena.

**GCH435** **Chemical Kinetics and Reactor Design** **3 cr.**  
**Pre-requisites** GCH410 And GCH355 and GMC451 (Y)

In today's industrial application, chemical reactors are used for producing desired products from the conversion of raw materials based on chemical reactions in a quantitative way described as chemical kinetics. The study in the following module presents a combination of reactor design and chemical kinetics. Reactor Design involves determining the reactor physical dimensions (volume, diameter, length, height, etc...); the time required for the reaction, and the cooling/heating requirements as a function of the operating parameters. Reaction kinetics is a consequence of the correlation between reaction rates (how fast a reaction occurs) and temporal/spatial distribution of temperature within the reactor.

The fundamental goal addressed in this course can be summarized in 3 simple questions:

- How to choose the best reactor type
- How to estimate size
- How to determine the best operating conditions

**GCH440** **Environment and Security in Chemical Industry** **3 cr.**  
**Pre-requisites** GCH355

The aim of this course is to provide the students with conceptual, practical and problem solving tools to preserve the quality of the environment and avoid accidents in the industry. Topics include hazard identification, risk analysis, assessment, management and control. The course emphasizes on environmental indicators of air pollution, water and soil quality criteria and standards, methods and procedures for characterizing environment. The students will be able to understand and apply risk analysis using different techniques, evaluate procedures, fault tree analysis, risk reduction and preventive measures in industrial safety.

**GCH450** **Separation Processes** **3 cr.**  
**Pre-requisites** GCH412 and GMC451

The main topics discussed in this course represent the main unit operation in the Engineering fields: Distillation process (atmospheric and vacuum distillations, rectification,...) – the graphic method of McCabe Thiele is largely discussed and applied with a material balance equations. Gas – Liquid Extraction process - McCabe Thiele Methods to estimate the total number of theoretical successive extractions.

**GCH451** **Unit Operations of Chemical Engineering** **3 cr.**  
**Pre-requisites** GCH434 and GCH450

The students taking this course have already learned the basic principles of mass transfer in the course "Mass Transfer for Chemical Engineers" as a prerequisite of this course. They have also acquired the basics of heat transfer from the course "Heat Transfer" during their studies at the chemical Engineering department. This course is a complementary to separation processes, and presents an advanced application of heat and mass transfer in the main unit operations in the process engineering. The main topics discussed in this course are related to the main principles of unit operations in the engineering fields: fixed and fluidized beds, crystallization, liquid-liquid extraction, evaporation (cooling towers and condensers), drying, fluid-solid separation, osmosis and reverse osmosis (Membrane separation). Other processes such as, absorption, adsorption, chromatography and ion exchange (agitated vessels) will be presented.

**GCH455** **Interfacial Phenomena and Colloids** **2 cr.**  
**Pre-requisites** GCH435

This course examines the factors underlying interfacial phenomena and focuses on the thermodynamics of surfaces, structural aspects, and electrical phenomena. Some applications are discussed in the domains of emulsion, detergency, foams, fluidization, sedimentation, nucleation, wetting, adhesion, flotation, and electrophoresis.

**GCH465** **Design of Chemical Reactors** **3 cr.**  
**Pre-requisites** GCH435 and GCH450

This course is the first building block of design where the student learns about the decision-making process in order to synthesize a good chemical process. In this course, we first introduce the main flowsheets of chemical processes and chemical plants including block flow diagram (BFD), process flow diagram (PFD) and piping and instrumentation diagram (P&ID). We present all drawing heuristics, nomenclatures, equipment symbols... and all tables associated with technical flowsheets. We follow by introducing heuristics for tracing chemical in a flowsheet. The second section includes the heuristics and the steps associated with designing a process from scratch or retrofitting an existing one. This includes decision making of the chemical reaction, batch vs. continuous, details of recycle, choice between various separation systems, main blocks of a generic process, choice between various utilities and many more. The last section introduces the concept of product design and specialty chemical, as opposed to what students commonly learn about (process design and commodity chemical). We also show and analyse the main approach for a product design including needs, ideas, selection, and manufacture.

**GCH470** **Process Design and Control** **3 cr.**  
**Pre-requisites** GEL425 And GCH435

This course introduces the tools to assess the behavior of chemical engineering systems after a disturbance, under steady state conditions, and through dynamic change.

**GCH471** **Separation and Spectroscopic Techniques Lab** **2 cr.**  
**Pre-requisites** GCH310

This module provides an overview of the current methods of analysis in diverse sectors such as the chemical and food industries, medical analysis laboratories, and environmental sciences. The idea is to connect the practical aspects of each studied method to its basic scientific concepts. Students will learn good laboratory practice through this module as well as the various separation methods (different chromatographic techniques) and spectroscopic techniques (IR, UV, NMR, fluorescence, atomic absorption and emission).

**GCH472** **Process Engineering Laboratory** **1 cr.**  
**Pre-requisites** GCH450 and GCH435

This laboratory offers students the opportunity to use all the basic knowledge to design, explore and optimize many basic operations. During this laboratory, the student will study the effect of corrosion on metals and water softening, dealkalisation and demineralization by ion exchange columns. The student will differentiate between chemical reactors and perform a hydrodynamic study residence time distribution and calculate chemical conversion rate of different reactors. The student will learn as well how to control temperature, pressure and flows (manually and using digital programs). Another part of this lab deals with a deep bed filtration apparatus to study the evolution of pressure drop through filter media at different flow rates.

**GCH474** **Process Instrumentation and measurements** **3 cr.**  
**Pre-requisites** GCH470

Running any industrial plant, and thereby guaranteeing the safety and the quality of the products, needs a complete understanding and mastering of the systems used to control the process and to maintain it in safe optimal conditions. Either these processes are as simple as producing hot water or keeping constant the water level in a tank, or as complex as controlling the oil refining process, they require using standard instrumentation combining many measurement sensors, controlling valves, speed drives and control systems. The objective of this course is to teach undergraduate chemical engineering students the basics of the control systems, making the right choices of what variables to control and how to measure and control them.

**GCH475** **Process Control Laboratory** **1 cr.**  
**Pre-requisites** GCH470 (Y)

Process control using computer simulation: develop mathematical models of chemical processes by writing unsteady state mass and energy balances, transient response of closed loop sampled data systems, design and control of complex systems including pumps, pipes, heat exchangers, tanks, boilers, ... Analysis and design of sampled data controllers, digital PI and PID controllers.

**GCH480** **Internship I** **1 cr.**  
**Pre-requisites** GCH450 and GCH435

† In order to register for this course, the students first spend a minimum of two months experience in the industry or a company and live a real life experience in the field of practice that they have chosen. Afterwards, the students present their "job" and what they learned from it in a well-structured and well-written scientific report.

**GCH525** **Plant Design** **3 cr.**  
**Pre-requisites** GCH465

This course contributes heavily to the professional component of the chemical engineering undergraduate curriculum. It is the chemical engineering capstone design course, where we put together all that students have learned previously into a coherent project(s). This unit requires the students to undertake a major design task utilizing the knowledge gained throughout the chemical engineering course. This comprises the following tasks: design of a process to meet a specified requirement; feasibility study of alternative processes which meet the specification; determination of sequence for investigation of a chemical manufacturing project and preparation of a report; consideration of environmental impacts and sustainability issues; preparation of flowsheets; confirmation of effects of market forecasts; economic evaluation; preparation of estimates for the minimization of capital and production costs; specification of equipment; selection of construction materials; and specification of instrumentation location, staff and labor requirements and safety precautions. The Aspen plus simulation package will be utilized where appropriate. This subject form the major capstone design project for the chemical engineering discipline and closely simulates the design procedures the graduate students will undertake in chemical industry as process and design engineers. The pre-requisites ensure that the students bring together all of the undergraduate knowledge and skills imparted in earlier years of the degree program. All aspects of the safe and environmentally responsible design of a chemical process plant are covered in this unit through project-based learning. Through a careful sequential approach, the students develop a feasibility study, an initial process scoping and development report, and finally, a detailed design report. Team work is emphasized throughout to mimic the typical team environment the students will encounter in the work place. Projects are chosen from chemical process plants that currently are under construction or being studied in the chemical processing industry, and chemical product design problems chosen from state-of-the-art chemical products.

**GCH541** **Introduction to Petroleum Engineering** **2 cr.**  
**Pre-requisites** GCH415

This course addresses the oil and gas field life cycle from prospect identification, through project commissioning to final abandonment. Students shall earn a firm understanding of the various phases and associated activities along with knowledge and tools relating disciplines across the exploration and production industry.

**GCH543** **Drilling Engineering** **3 cr.**  
**Pre-requisites** GCH415

This course presents the basics of drilling operations. Students will learn to visualize what is taking place down hole. They will go through all drilling steps and techniques and will understand how upstream services interact with the overall drilling process.

**GCH544** **Midstream Oil and Gas Fundamentals** **3 cr.**  
**Pre-requisites** GMC430 and GMC435

The aim of this course is to teach the students on the midstream sector of the oil and gas industry. This includes storage and transport of oil, gas, and LNG. The course will also cover pipeline infrastructure, transmissions systems, maritime transportation and more. The course will give insight on the geopolitics of oil and gas, its relation to transport, and a special focus on the Lebanese case.

**GCH545** **Advanced Chemical Engineering Thermodynamics** **3 cr.**

Efficient separation operations and many other chemical processes depend on a thorough understanding of the properties of gaseous and liquid mixtures. This course will interpret, correlate, and predict thermodynamic properties used in mixture-related phase-equilibrium calculations. Basic statistical mechanical principles and intermolecular forces will be discussed, and applied to the correlation and prediction of thermodynamic

properties and phase equilibria. Statistical thermodynamics will be shown to work with classical thermodynamics, molecular physics, and physical chemistry to solve real-world problems.

**GCH547 Advanced Kinetics and Reactor Design 3 cr.**  
This course is a study of chemical kinetics and mechanisms in complex homogeneous and heterogeneous reaction systems, and the design and analysis of chemical reactors for such systems.

The course covers the science and engineering of reactive chemical systems. Ideal reactors are modeled. The theory of chemical reactions in the gas phase from fundamental physical chemical principles is introduced. Reacting systems are identified and analyzed at the level of elementary steps, including single, chain and catalytic reactions. Mathematical models for heterogeneous reactions, including associated mass transfer limitations, are also developed.

**GCH548 Mathematical Modeling 3 cr.**  
Students will examine the formulation and solution of mathematical models of a range of chemical processes with an emphasis on differential balances and incorporation of uncertainty.

This course introduces a range of analytical and numerical methods for the solution of mathematical equations encountered in chemical engineering. Topics are motivated by and presented in the context of physical phenomena encountered in chemical engineering industrial and research problems. The accuracy and computational complexity of each approach, along with their potential modes of failure, are highlighted. Attention is also given to interpretation and handling of uncertainty in the context of different problems. MATLAB is used in the course as a vehicle for teaching basic programming technique and the use of commercial numerical packages.

**GCH549 Unit Integration Design and Control 3 cr.**  
Reactive distillation is an excellent example of process innovation and intensification. In this course we introduce reactive distillation process design and control, starting with the steady-state design of an ideal quaternary system, steady-state design of real chemical systems, and control of ideal systems. Students will also learn about hybrid and non-conventional systems. By the end of the course students should be able to design and control at least one reactive distillation process.

**GCH550 Catalytic Processes 2 cr.**  
**Pre-requisites** GCH435

Catalysis improves the speed and selectivity of chemical reactions, and allows the production of reactions under optimized conditions (room temperature, atmospheric pressure). The aim of the course is to give students a basic knowledge of the catalysis technology: homogeneous catalysis, heterogeneous catalysis, enzyme catalysis (biocatalysis), and photocatalysis. The different steps to synthesize a catalyst, different catalytic processes, such as the typical refinery processes of cracking, alkylation, reforming, hydrotreating, and petrochemical processes such as epoxidation, ammonia synthesis, and prevention of pollution such as vehicle emissions (SCR of NOx and NOx trap) will be discussed in detail.

**GCH551 Applied Electrochemistry and Corrosion 3 cr.**  
**Pre-requisites** GCH347

This course aims to introduce the fundamentals of electrochemistry for understanding electrochemical processes involving charge transfer and their applications, looking at accumulators and corrosion.

**GCH552 Reservoir Characterization 3 cr.**  
This course will cover various petroleum engineering disciplines within the upstream phase of the oil and gas industry. An intermediate level of knowledge will be gained by students on subjects such as petroleum geology, formation evaluation, well testing, reservoir simulation, well performance and production management. Students will go through practical exercises of what they learnt in theory on respective modules of Ecrin Software developed by KAPPA Engineering.

**GCH558 Petroleum Geology 2 cr.**  
**Pre-requisites** GCH347

This course aims at providing students with general knowledge in Geology and will emphasis on earth processes pertaining to and affecting the petroleum systems. The course shall cover also reserves estimation, classification and geological modeling.

**GCH559 Formation Evaluation 3 cr.**  
**Pre-requisites** GCH558

This course provides students with working knowledge in the field of well logging and formation evaluation. Students will learn and understand logging methodologies and the principles and physics of tools used in acquiring various types of logs. The course will also cover fundamental techniques of well log processing, analysis and petrophysical evaluations.

**GCH562 Process Simulation Lab 1 cr.**  
**Pre-requisites** GCH465

This laboratory offers to the student the opportunity to use Aspen program, a computer-based process simulator, to study different industrial process. This includes: Liquefaction of Propane, Simple binary separation of propane from isobutene, Complex distillation of Acetone/methanol, Ammonia synthesis, Vinyl chloride production from Ethylene, Aspen Plus Simulation of Plant Design and process control using Aspen plus.

**GCH564 Water and Waste Treatment 3 cr.**  
**Pre-requisites** GMC430 and GMC435

The course covers principles of treatment of domestic and industrial water, waste water and sludge. It also includes: unit operations in water and waste water treatment (physical, chemical and biological unit operations for water treatment and pollution control problems); industrial waste water treatment (Industrial Waste water treatment process review : application of various biological, chemical, and physical processes for pollution control and meeting environmental regulations for practical discharge); drinking water (treatment and public health issues); fundamentals and applications of drinking water treatment processes, interactions among treatment processes, source water quality, and public health issues; Design of softening and reverse osmosis plants for water treatment.

**GCH565 Food and Pharmaceutical Processes 3 cr.**  
**Pre-requisites** GCH450

Students will learn about food and pharmaceutical processes, specifically: food and medication analysis and quality control; food safety and new product development; regulations, quality assurance, production; and evaluation of both food and pharmaceuticals processes.

**GCH566 Production and Processing of Metals 3 cr.**  
**Pre-requisites** GCH347

In this course, students will be introduced to metallurgy unit operations (pyrometallurgical and hydrometallurgical facilities), the description of unit operations (Mass and Energy Balance, thermodynamics, kinetics), the steel industry (blast furnace, conversion processes, alternative processes), the metallurgy of non-ferrous metals (copper, zinc, lead, reagent metals: aluminum, titanium), and metal recycling.

**GCH570** **Petroleum Laboratory** **1 cr.**

**Pre-requisites** GCH347

The purpose of this lab is to learn how to identify minerals and rocks in preparation for later labs, including our field trips to investigate the local geology. The course involves also testing of the petro-physical properties of the rocks such as porosity, permeability, fluid saturations and viscosities. Identifying rocks is an important skill and the more you practice, the easier it becomes. You start out by determining the general class of rock — igneous, metamorphic, or sedimentary — and then proceed to identify the minerals that make up the rock and then the texture of the rock.

Current Version (Software): This course will provide students with working skills on Rockworks17 Software, a subsurface/petroleum Geology Software.

**GCH571** **Process Integration Lab** **3 cr.**

This course will cover the advanced level of process integration and pinch problem theory. It will introduce the newest technologies applied in that field. Students will use first principles, and simulators (such as heat) in order to design a process integration network for both chemical and petrochemical selected processes.

**GCH573** **Advanced Process Engineering Lab** **1 cr.**

**Pre-requisites** GCH 450 And GCH 434

This laboratory offers to the students the opportunity to use advanced knowledge of some operation units and their use in applications in the chemical engineering field. It deals with: gas-liquid absorption, multi-function distillation (batch, continuous); absorption with and without chemical reaction, Liquid-Liquid extraction, crystallization. Experiments will also deal with the applications of some operation units in food processing (e.g. concentration by evaporation).

**GCH574** **Properties of Polymers** **2 cr.**

**Pre-requisites** GCH415 And GCH347

Synthetic polymers have become an integral part of our lives and can be found in many every day and advanced materials: rubber tires, bullet-proof vests, paints, fibers, contact lenses, drug delivery vehicles and many others. This is a course that investigates these natural and man-made materials. We explore how these materials are synthesized, evaluated, and what their commercial applications are. We also review important properties that these materials possess, including their molecular, physical, chemical, thermal, mechanical, and electrical properties. Students will be introduced to the methods of preparation of advanced polymer structures, such as block, star and brush copolymers, semi-conducting and biodegradable polymers. Finally, the forming techniques for plastics (compression molding, injection molding) and the different parameters leading to the degradation of polymers will also be covered. At the end of this course, students will know all the details concerning polymer structures, the characteristics, application and processing of polymers, the structure and synthesis of new polymer materials used in different research areas, the different forming techniques for plastics, and all the factors responsible for the degradation of polymers.

**GCH575** **Petroleum Refining Techniques** **3 cr.**

**Pre-requisites** GCH415

The objective of this course is to familiarize the student with the technologies and business fundamentals related to petroleum refining processes, operations, feedstock and products characteristics.

- Emphasis will be placed on how to use crude oil assays and on understanding of petroleum chemistry with applications to process design and analysis of typical refinery operations.

- Description of main conversion processes and their evolution will be addressed considering environmental and economic considerations.

- Simulation software for crude oil characterization, fractionation, and refining unit operations will be utilized.

**GCH579** **Analysis of Petroleum Products Lab** **1 cr.**

**Pre-requisites** GCH415

This laboratory introduces various methods of analysis by using sophisticated instruments and analytical equipment to determine various physical properties of crude, natural gas, petroleum products and petro-chemicals. Through this module students will learn the theoretical principles and experimental procedures for quantitative estimation.

**GCH581** **Internship II** **1 cr.**

**Pre-requisites** GCH596

In order to register for this course, the students first spend a minimum of two months experience in the industry or a company and live a real life experience in the field of practice that they have chosen. Afterwards, the students present their "job" and what they learned from it in a well-structured and well-written scientific report.

**GCH596** **Final Project I** **1 cr.**

This course pushes the students to demonstrate preparedness to start their careers as professional engineers by undertaking an investigation of a research topic relevant to the profession and by appraising its practical experience. The research topic will give the students the opportunity to marshal the relevant knowledge and skills from various courses and laboratories of the program and apply them to the investigation of an approved research topic and then to produce a report of a professional standard.

**GCH597** **Final Project II** **3 cr.**

**Pre-requisites** GCH596

This course pushes the students to demonstrate preparedness to start their careers as professional engineers by undertaking an investigation of a research topic relevant to the profession and by appraising its practical experience. The research topic and applied developed product or study will give the students the opportunity to marshal the relevant knowledge and skills from various courses and laboratories of the program and apply them to the investigation of an approved research topic and then to produce a report of a professional standard. This course requires students to exhibit/develop a proactive approach to manage, orient and present a project.

**GCH600** **Special Topic in Chemical Engineering** **3 cr.**

**GCH620** **Plant Design** **3 cr.**

This is the chemical engineering capstone design course, where we put together all that students have learned previously into a coherent project(s). This unit requires the students to undertake a major design task utilizing the knowledge gained throughout the chemical engineering course.

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                              |              |

| A course covering the concepts of feedback control systems in the chemical and process industry. The course involves dynamic modeling, design and analysis of dynamic control systems.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                              |              |
| <b>GCH631</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>Introduction to Petroleum Engineering</b> | <b>2 cr.</b> |
| This course addresses the oil and gas field life cycle from prospect identification, through project commissioning to final abandonment. Students shall earn a firm understanding of the various phases and associated activities along with knowledge and tools relating disciplines across the exploration and production industry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                              |              |
| <b>GCH632</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>Water and Waste Treatment</b>             | <b>3 cr.</b> |
| The course covers principles of treatment of domestic and industrial water, waste water and sludge. It also includes: unit operations in water and waste water treatment (physical, chemical and biological unit operations for water treatment and pollution control problems); industrial waste water treatment (Industrial Waste water treatment process review : application of various biological, chemical, and physical processes for pollution control and meeting environmental regulations for practical discharge); drinking water (treatment and public health issues); fundamentals and applications of drinking water treatment processes, interactions among treatment processes, source water quality, and public health issues; Design of softening and reverse osmosis plants for water treatment. |                                              |              |
| <b>GCH640</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>Purification of Petroleum Products</b>    | <b>3 cr.</b> |

| The objective of this course is for students to understand the role played by chemical engineers in these branches of industry, become familiar with all unit operations used by the food and pharmaceutical industries, and to develop the ability to integrate all scientific and technical knowledge among the food and pharmaceutical engineering processes. Topics covered by this course are: drying processes, axis conditioning and humidification, extraction, crystallization, filtration, evaporation and distillation, cooling, stirring, mixing, extrusion cooking, mechanical operations (milling, screening, etc.), membrane and chromatographic separations, biological processes, handling and storage of granules and powders.                                                                     |                                              |              |
| <b>GCH643</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>Production and Processing of Metals</b>   | <b>3 cr.</b> |
| This course covers the following topics: unit operations of metallurgy (pyrometallurgical and hydrometallurgical plants), description of unit operations (material and energy balances, thermodynamic description, kinetic description), steel (high furnace processes, processes converters, alternative methods), metallurgy of non-ferrous metals (copper, zinc, lead, reactive metals: aluminum, titanium), metal recycling.                                                                                                                                                                                                                                                                                                                                                                                     |                                              |              |
| <b>GCH652</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>Reservoir Characterization</b>            | <b>3 cr.</b> |
| This course will cover various petroleum engineering disciplines within the upstream phase of the oil and gas industry. An intermediate level of knowledge will be gained by students on subjects such as petroleum geology, formation evaluation, well testing, reservoir simulation, well performance and production management. Students will go through practical exercises of what they learnt in theory on respective modules of Ecrin Software developed by KAPPA Engineering.                                                                                                                                                                                                                                                                                                                                |                                              |              |
| <b>GCH653</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>Drilling Engineering</b>                  | <b>3 cr.</b> |
| This course presents the basics of drilling operations. Students will learn to visualize what is taking place down hole. They will go through all drilling steps and techniques and will understand how upstream services interact with the overall drilling process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                              |              |

| This course covers the topic of reservoir simulation. It teaches students how to build a static and dynamic reservoir model. Bases of reservoir engineering are reviewed and students will be taught how to set up a conceptual model, create various types of grids, input petrophysical parameters and run a numerical model.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                              |              |
| <b>GCH656</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>Field Development Planning</b>            | <b>3 cr.</b> |
| This course covers the subject of field development planning. It teaches the fundamentals of writing a development plan. It combines both knowledge of subsurface and surface aspects in order to design a development plan up to taking a decision on optimal exploitation and development scenarios.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                              |              |

| This course provides students with basic knowledge of PTA - Pressure Transient Analysis (previously called well testing). Students will understand what is a well test, how it is carried, its types, data inferred from its analysis and workflows adapted for interpretation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                              |              |

| This course aims at providing students with general knowledge in Geology and will emphasis on earth processes pertaining to and affecting the petroleum systems. The course shall cover also reserves estimation, classification and geological modeling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                              |              |

| This course provides students with working knowledge in the field of well logging and formation evaluation. Students will learn and understand logging methodologies and the principles and physics of tools used in acquiring various types of logs. The course will also cover fundamental techniques of well log processing, analysis and petrophysical evaluations.                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                              |              |

| <b>GCH670</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>Petroleum Laboratory</b>                         | <b>1 cr.</b> |
| The purpose of this lab is to learn how to identify minerals and rocks in preparation for later labs, including our field trips to investigate the local geology. The course involves also testing of the petro-physical properties of the rocks such as porosity, permeability, fluid saturations and viscosities. Identifying rocks is an important skill and the more you practice, the easier it becomes. You start out by determining the general class of rock — igneous, metamorphic, or sedimentary — and then proceed to identify the minerals that make up the rock and then the texture of the rock. Current Version (Software): This course will provide students with working skills on Rockworks17 Software, a subsurface/petroleum Geology Software.                                                                                                                                                                                                                                                                           |                                                     |              |

| The course provides knowledge of legal aspects of petroleum exploration and exploitation both internationally and in Lebanon. It focuses on regulation of so called upstream petroleum activities and covers the most common contractual and concessionary models in use internationally for exploration and exploitation of petroleum. In addition to Law, the courses tackles petroleum economics and risk analysis and helps understand the theories and methods used to value oil and gas projects.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                     |              |

| This laboratory introduces various methods of analysis by using sophisticated instruments and analytical equipment to determine various physical properties of crude, natural gas, petroleum products and petro-chemicals. Through this module students will learn the theoretical principles and experimental procedures for quantitative estimation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                     |              |
| <b>GCH676</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>Advanced Chemical Engineering Thermodynamics</b> | <b>3 cr.</b> |
| Efficient separation operations and many other chemical processes depend on a thorough understanding of the properties of gaseous and liquid mixtures. This course will interpret, correlate, and predict thermodynamic properties used in mixture-related phase-equilibrium calculations. Basic statistical mechanical principles and intermolecular forces will be discussed, and applied to the correlation and prediction of thermodynamic properties and phase equilibria. Statistical thermodynamics will be shown to work with classical thermodynamics, molecular physics, and physical chemistry to solve real-world problems.                                                                                                                                                                                                                                                                                                                                                                                                       |                                                     |              |
| <b>GCH677</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>Mass Transport</b>                               | <b>3 cr.</b> |
| Students will examine the mathematical description of mass transport processes, including analytical solutions for steady state, transient, and multi-dimensional diffusion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                     |              |
| This course explores a wide range of mass transfer behavior for binary and multicomponent systems that are encountered in chemical engineering. Special attention will be given to developing mathematical solutions to common steady and transient mass transfer problems, with an emphasis on understanding the physical implications of such systems. Fick's law, flux definitions, constitutive equations, and conservation equations will be developed. Steady and transient mass transfer by diffusion will be analyzed in detail along with convective mass transfer, mass transport in flowing media, and free convection. Models will also be developed for mass transfer with simultaneous homogeneous or heterogeneous reaction and simultaneous heat and mass transfer. Attention is also given to the development of boundary layer theory and correlations for mass transfer by forced convection. Special topics may include: membrane separation processes, drug delivery and controlled release, and adsorption separations. |                                                     |              |
| <b>GCH678</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>Advanced Kinetics and Reactor Design</b>         | <b>3 cr.</b> |
| This course is a study of chemical kinetics and mechanisms in complex homogeneous and heterogeneous reaction systems, and the design and analysis of chemical reactors for such systems.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                     |              |
| The course covers the science and engineering of reactive chemical systems. Ideal reactors are modeled. The theory of chemical reactions in the gas phase from fundamental physical chemical principles is introduced. Reacting systems are identified and analyzed at the level of elementary steps, including single, chain and catalytic reactions. Mathematical models for heterogeneous reactions, including associated mass transfer limitations, are also developed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                     |              |
| <b>GCH679</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>Mathematical Modeling</b>                        | <b>3 cr.</b> |
| Students will study the formulation and solution of mathematical models of a range of chemical processes with an emphasis on differential balances and incorporation of uncertainty. This course introduces a range of analytical and numerical methods for the solution of mathematical equations encountered in chemical engineering. Topics are motivated by and presented in the context of physical phenomena encountered in chemical engineering industrial and research problems. The accuracy and computational complexity of each approach, along with their potential modes of failure, are highlighted. Attention is also given to interpretation and handling of uncertainty in the context of different problems. MATLAB is used in the course as a vehicle for teaching basic programming technique and the use of commercial numerical packages.                                                                                                                                                                               |                                                     |              |
| <b>GCH680</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>Unit Integration Design and Control</b>          | <b>3 cr.</b> |
| Reactive distillation is an excellent example of process innovation and intensification. In this course we introduce reactive distillation process design and control, starting with the steady-state design of an ideal quaternary system, steady-state design of real chemical systems, and control of ideal systems. Students will also learn about hybrid and non-conventional systems. By the end of the course students should be able to design and control at least one reactive distillation process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                     |              |
| <b>GCH681</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>Process Integration Lab</b>                      | <b>1 cr.</b> |
| This course will cover the advanced level of process integration and pinch problem theory. It will introduce the newest technologies applied in that field. Students will use first principles, and simulators (such as heat) in order to design a process integration network for both chemical and petrochemical selected processes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                     |              |
| <b>GCH691</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>Thesis I</b>                                     | <b>1 cr.</b> |
| <b>GCH692</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>Thesis II</b>                                    | <b>5 cr.</b> |
| <b>Pre-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | GCH691                                              |              |
| <b>GCV301</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>Surveying</b>                                    | <b>1 cr.</b> |
| <b>Pre-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | MAT337 And GCV320                                   |              |
| Surveying may be defined as the art of making measurements of the relative positions of natural and manmade features on the earth's surface and the presentation of this information either graphically or numerically. On completion of this course the surveying students will be able to demonstrate competency in the following areas: explain the meaning of a number of common terms used in surveying and mapping; utilize                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                     |              |

horizontal and vertical references; prepare and apply the use of survey field notes; use the theory of measurements, linear measurements, angles, topographic surveys; construct alignment sheets for construction design; construct a topographic map utilizing horizontal and vertical values.

**GCV302 History of Architecture 2 cr.**  
Based mainly on the architectural timeline, the course focuses on the construction periods, their key events, their most important buildings, technical inventions, socio-historical contexts, and symbolic meanings. It locates the most important milestones in the discipline and gives the students a comprehensive global view of architecture evolution, its technical and esthetical correlation as well as its connection with other disciplines.

**GCV310 Reinforced Concrete I 3 cr.**  
**Pre-requisites** GCV401

Students completing this course will be able to explain and apply the principles of reinforced concrete; assign and assess proper dead, live and other structural loads; have the capability to design and analyze reinforced concrete beams, slabs, and columns for flexure, shear and axial loads using ACI standard (ACI 318); use and understand the functionality of the design and analyze reinforced concrete elements using design software; coordinate, elaborate and work in a team during the group course project; and finally the students will be able to write a group project report and present parts of the results in front of the class.

**GCV320 Technical Drawings 1 cr.**  
The objective of these practical workshops is to initiate the students in the use of AutoCAD software. In the early stages they will learn about the fundamental operations that are sufficient to achieve technical drawings in 2D. The students thereafter become more proficient in using AutoCAD for the objective of realizing projects in civil engineering. We insist on the tools and the available modules (management of project, insertion of block of components, realization of report) permitting a fast realization of projects and plans of electric facilities.

**GCV401 Structural Analysis 3 cr.**  
**Pre-requisites** GMC440

Upon completion of this course the students will be able to: identify the types of structures (beams, frames, arches, trusses) and describe their behavior; determine, according to the codes, different design loads to be considered in the design of structures; calculate the support reactions and internal forces and draw diagrams of these efforts for statically indeterminate structures; calculate the rotations and displacements suffered by the structures; factor in loads and load combinations; and design according to the National Building Codes. The course also examines the calculation of complex truss arches and frames; calculation of deflections by the Energy methods and virtual work method; influence lines; and calculation of indeterminate structures (beams, trusses and frames) using the three moments (Clapeyron) method.

**GCV405 Reinforced Concrete II 3 cr.**  
**Pre-requisites** GCV310

This course covers the analysis and design of the bond, development lengths, and splices; slender columns, and biaxially bent columns; wall footings, concentrically and eccentrically loaded single column footings, and combined footings; staircases; bearing walls; cantilever retaining walls; one way and two way slab design; an introduction to seismic resistance and shear wall design.

**GCV410 Geology and Geophysics 3 cr.**  
**Pre-requisites** GMC440

This course introduces the students to the earth as a dynamic planet, and provides basic knowledge of the various processes shaping the earth's surface and interior. Students will thus have specific knowledge of the theories and principles governing the natural systems. It will also enable them to understand how humans affect their natural environment and vice versa. This course also introduces the concepts of geophysical investigations, mapping and satellite image interpretation.

**GCV420 Soil Mechanics 3 cr.**  
**Pre-requisites** GMC440

This course aims to introduce the students to the fundamentals of soil mechanics parameters which will be useful for the design of geotechnical components. It includes all basic requirements needed by the students in order to classify soil type, to define the related parameters, the soil resistance and to evaluate the soil behavior when it may be subjected to external stresses.

**GCV430 Construction Materials 2 cr.**  
**Pre-requisites** GMC440

This course will familiarize students with the basic construction materials used in the building construction process such as aggregates, cement, concrete, steel, wood and ceramics. The fundamental principles of the behavior, physical and engineering properties of various common civil engineering materials will be introduced. Students learn about material and product manufacturing techniques and how they relate to mechanical and non-mechanical properties of the various materials. Resulting from this course, students will gain a comparative knowledge of material properties and possible applications in construction.

**GCV440 Infrastructures and Roads 3 cr.**  
**Pre-requisites** GCV430 And GCV320

This course covers a wide range of topics that includes an introduction to transportation engineering, functional and context classifications of roads, mobility and access controls of roads, considerations of all transportation modes in the design, drivers performance and human factors, traffic characteristics, and elements of design (horizontal and vertical alignments; sight distances; grades; and superelevation).

**GCV450 Architectural Project 1 cr.**  
**Pre-requisites** GCV302 And GCV320

It is essential for civil engineers to acquire the basic skills to conduct architecture projects (concept, development, and drawings). This course prepares students to properly understand, read and develop architectural plans, helping them coordinate on projects with architects in the future.

**GCV460 Management and Site Organization 2 cr.**  
**Pre-requisites** GCV405

This course considers the responsibilities for planning, organizing, monitoring, controlling and administering groups of staff, e.g. site manager.

**GCV461 General Procedures of Construction 1 cr.**  
**Pre-requisites** GCV450

This course will introduce students to onsite construction operations, with a focus on construction methods, equipment, and safety considerations. It will also train students to consider alternative solutions, which includes selection of the most suitable equipment and methods for the operations at hand. Case examples are introduced to familiarize students with good construction practice. Topics include site preparation and earthwork, wood

frame, masonry, concrete formwork, shoring and underpinning work excavation at depth, and design, assembly and dismantling of temporary construction works. The course also aims at introducing students to soft skills, including teamwork and communication skills.

**GCV462 Building Legislation 1 cr.**  
**Pre-requisites** GCV450

This course defines the regulations and the relevant requirements to be achieved and provided in order to get the construction permit from the Lebanese authorities (Urbanism Agency) based on the construction law and the OEA law.

**GCV463 Specifications and Bill of Quantities 1 cr.**  
**Pre-requisites** GCV450

A course on the structure of construction documents and their interrelationships, bidding requirements, general and particular contract conditions, administrative and procedural requirements for construction, technical specifications, breakdown structure and BOQ, construction cost estimation processes, and unit rates determination and pricing.

**GCV465 Foundations and Retaining Walls 3 cr.**  
**Pre-requisites** GCV310 and GCV401 And GCV420

This course aims to cover site investigations; evaluation of data from field and laboratory tests; estimation of stresses in soil masses; and proceeding with applications of principles of soil mechanics in the determination of bearing capacity and settlement of spread footings, mats, single piles, and pile groups. In parallel, this course aims to show the basic principles for the determination of the lateral stresses to be adopted in the calculation of the retaining systems and proceeding with some applications to calculate the stability of the retaining walls. This course includes all basic requirements needed by the students in order to be capable of designing the different types of foundation and retaining systems.

**GCV471 Soil Mechanics Lab 1 cr.**  
**Pre-requisites** GCV420

This course aims to introduce the students to the fundamentals of laboratory testing of soil. It includes laboratory teaching to familiarize students with standard soil testing techniques which are considered as a must for the determination of soil parameters needed to design the geotechnical components.

**GCV472 Construction Materials Lab 1 cr.**  
**Pre-requisites** GCV430

This course aims to introduce the students to the fundamentals of laboratory testing of construction materials. They will make measurements of behavior of various materials used in civil engineering among many tests, provide physical observations, introduce experimental procedures and common measurement equipment, and gain exposure to a variety of established material testing techniques. A dual approach characterizes these experiments: discovery/control of equipment and measurement/interpretation.

**GCV480 Internship I 1 cr.**  
**Pre-requisites** GCV401

The objective of this course is to introduce the students to the real work of the engineer on the site project and to the real work in the consultant engineering offices.

**GCV500 Prestressed Concrete 2 cr.**  
**Pre-requisites** GCV310

This course describes the design methods and the material characteristics of the prestressed elements, prestress losses, working strength design procedures, composite construction, ultimate flexural strength and behavior, shear design, continuous prestressed concrete members, and a case study/project.

**GCV501 Seismic Design 3 cr.**  
**Pre-requisites** GEN450 And GCV310

This course examines: the nature of earthquake ground motion; seismic hazard evaluation in engineering practice; response analysis of structures and effect of soil conditions on structural response and behavior under earthquake ground motion; design of structures under earthquake loading. There is also an introduction to the UBC, IBC and PS standards.

**GCV502 Urban Planning 3 cr.**  
**Pre-requisites** GCV440

This course presents concepts, methods, and techniques that are used for urban planning and treats the urban area as a system for the purpose of planning infrastructure (e.g., transportation, water supply, waste water disposal).

**GCV505 Advanced Structural Analysis 3 cr.**  
**Pre-requisites** GCV401

This course covers: the analysis of statically indeterminate structures by flexibility (force) and stiffness methods; an introduction to the direct stiffness method, Cross method; influence lines for indeterminate structures; computer structural analysis applications; project building modeling and assessment; and an introduction to the non-linear analysis, P-D analysis.

**GCV510 Sustainable Construction 3 cr.**  
**Pre-requisites** GCV430 And GCV450

The aim of this course is to provide an introduction to the principles of green building, including water, energy, resource efficiency, and waste reduction. It also looks at how to implement greenhouse gas emission management principles, such as emission reduction goals, accounting techniques and standards, and comprehensive emissions reduction plans and evaluation of the building performance according to LEED standards. The students will be able to analyze energy audits, conservation measures, codes and standards, and daylight simulation/modeling tools for various building types.

**GCV512 Bridges 3 cr.**  
**Pre-requisites** GCV310

This course discusses: types of bridges; influence lines; loads and their distribution on bridges; serviceability of bridges; methods of design of bridge deck, superstructure, and substructure. Standards and norms (i.e AASHTO) are also included.

**GCV514 Pavement Analysis, Design, and Maintenance 3 cr.**  
**Pre-requisites** GCV440

Students will be introduced to: traffic analysis, environmental conditions, soil and drainage; material characterization and mix design; structural design; maintenance and rehabilitation; pavement monitoring; and pavement management systems.

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                  |              |

| Special structures are true three-dimensional representations of our equilibrium equations and affirmations of our analytical techniques, design standards and construction practice. They include many types of structures, such as space frames or grids, cable and strut and tensegrity, self-erecting and deployable, cable net, tension membrane, lightweight geodesic domes, folded plates, and thin shells.                                                                                                                                                                                                                                                                                                   |                                                                  |              |

| This course will allow students to learn about Mechanical, Electrical, Plumbing, and Fire (MEP) systems in buildings. A special coordination and planning system is needed to minimize delays and interferences. This course will enable students to understand these systems and also to schedule, estimate and coordinate them within the general construction process.                                                                                                                                                                                                                                                                                                                                            |                                                                  |              |

| Finishes and materials introduces the building materials and finishes used in interior and exterior applications in the context of their environmental impact, their implications for human health and safety, and their potential contribution to the design of architectural elements. This course teaches students to explore the diversity of interior building and finishing materials, and provides the technical vocabulary and scientific concepts associated with procedures used for their fabrication, testing and evaluation.                                                                                                                                                                            |                                                                  |              |

| This course will provide a basic understanding of the physical and chemical aspects of hydrogeology. The emphasis will be on low temperature groundwater and groundwater surface water systems. This course includes a module on hydrogeology of geothermal systems, volcanoes, etc. This course will address the occurrence, movement, and reaction of water within the earth's subsurface. We will emphasize the evaluation of flow directions and rates, calculation of hydraulic properties, and processes controlling the composition of ground water.                                                                                                                                                          |                                                                  |              |
| <b>GCV532</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>Rock Mechanics</b>                                            | <b>3 cr.</b> |

| This course provides general analytical tools and experimental methods that are used in rock mechanics. Theoretical topics covered in the lectures include fundamental concepts of stresses and strains, the linear elastic constitutive model of rocks, failure modes and models of rocks, fracture mechanisms and models of rocks, inelastic behavior of rocks, and seismic waves.                                                                                                                                                                                                                                                                                                                                 |                                                                  |              |

| This is an introductory course on Geographic Information Systems (GIS) and their applications in the planning and engineering fields, alternatives in computer based graphics, data concepts and tools, network data management and planning applications, and implementation issues. This course satisfies the departmental requirements in all graduate engineering programs.                                                                                                                                                                                                                                                                                                                                      |                                                                  |              |
| <b>GCV534</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>Soil Dynamics</b>                                             | <b>3 cr.</b> |
| <b>Pre-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | GCV501                                                           |              |

Students will study: the geotechnical considerations of earthquake engineering and foundation vibrations; seismic surveying; ground motion during earthquakes; determination of soil properties for ground response analysis; dynamic properties of soils; soil structure interaction effects; soil liquefaction; dynamic analysis of earth dams; settlements resulting from earthquakes; lateral earth pressures during earthquakes; and foundation vibrations.

|                       |                                                |              |

| <b>GCV536</b>         | <b>Geotechnics of Roads</b> | <b>3 cr.</b> |
| <b>Pre-requisites</b> | GCV465                      |              |

This course covers advanced techniques in geomechanics, looking at subsurface exploration and soil investigation for the roads, as well as ground improvement techniques under the roads.

|                       |                              |              |
|-----------------------|------------------------------|--------------|
| <b>GCV541</b>         | <b>Waste Water Treatment</b> | <b>3 cr.</b> |
| <b>Pre-requisites</b> | GMC435                       |              |

A course that examines the quality and treatment methods of water and waste water, and testing for physical, chemical, and biological parameters.

|                       |                                        |              |
|-----------------------|----------------------------------------|--------------|
| <b>GCV542</b>         | <b>Management and Economy of Water</b> | <b>3 cr.</b> |
| <b>Pre-requisites</b> | GMC435                                 |              |

This course provides an introduction to water resource management challenges and the many complex factors that contribute to them. Some topics that will be discussed are water supply concerns given population growth and increasing demand, uncertainty in light of climate change, water quality issues stemming from point and nonpoint sources of pollution and from a lack of sanitation, and the geopolitics surrounding bulk water exports and sharing trans-boundary waters. Approaches for addressing water-related issues will be explored, including conceptual frameworks like Integrated Water Resource Management (IWRM) and the human right to water, and management tools like pricing and privatization.

|                       |                           |              |
|-----------------------|---------------------------|--------------|
| <b>GCV543</b>         | <b>Irrigation Network</b> | <b>3 cr.</b> |
| <b>Pre-requisites</b> | GMC435                    |              |

This course will introduce students to: source materials for irrigation projecting, hydrological, climatic, geological and hydrogeological; preparation of irrigation constructions, standardization, construction documentation; investment goals; preparation documentation, projecting task; documentation of real type of constructions; projecting of soil unit; proposal of irrigation detail, proposal of water distribution, its flow capacity and dimension of pipe network; application of linear programming for optimization of pipe network; reviewing of irrigation equipment characteristics from the viewpoint of suitability for plants and soil; and drawing documentation of an operational project, its realization.

|                       |                         |              |
|-----------------------|-------------------------|--------------|
| <b>GCV544</b>         | <b>Urban Hydraulics</b> | <b>3 cr.</b> |
| <b>Pre-requisites</b> | GMC435                  |              |

The aim of the course is to study the hydrology and drainage requirements of urban areas. Throughout the course, we introduce the effects of urbanization on the hydrological cycle, and develop basic methods of hydrological analysis including rainfall runoff models and flood frequency analysis. We review the basics of rainfall analysis and hydraulics, and apply this to storm, foul and combined sewer design. We explore sewer flow and quality models, storm water management and the increasing influence of sustainability principles.

|                       |                                |              |
|-----------------------|--------------------------------|--------------|
| <b>GCV550</b>         | <b>Highway and Road Design</b> | <b>3 cr.</b> |
| <b>Pre-requisites</b> | GCV440                         |              |

This course examines: the contemporary road design approach; the speed parameter; design consistency; 3-D design controls; esthetic road design criteria; energy and environmental impacts of highway design; design for heavy vehicles and powered two wheelers; at grade unsignalized intersections; roundabouts; interchanges; standards and practices in Lebanon.

|                       |                                                    |              |
|-----------------------|----------------------------------------------------|--------------|
| <b>GCV551</b>         | <b>Transportation Systems and Traffic Analysis</b> | <b>3 cr.</b> |
| <b>Pre-requisites</b> | GCV440                                             |              |

Students will learn about: transportation planning; the four step method; discrete choice models in transportation systems analysis ; intermodal transport; freight and logistics; project evaluation and cost-benefit analysis; traffic flow characteristics; traffic flow models; highway capacity and level of service.

|                       |                                                             |              |
|-----------------------|-------------------------------------------------------------|--------------|
| <b>GCV552</b>         | <b>Statistical Methods for Transportation Data Analysis</b> | <b>2 cr.</b> |
| <b>Pre-requisites</b> | STA307 And GCV440                                           |              |

The course explains: data management and data editing; descriptive and exploratory statistics; probability models and statistical inference; multivariate statistics; and statistical learning methods.

|                       |                                   |              |

| <b>GCV553</b>         | <b>Traffic Management Systems</b> | <b>3 cr.</b> |
| <b>Pre-requisites</b> | GCV440                            |              |

The course contents are: an introduction to Intelligent Transportation Systems; traffic surveillance methods; automatic vehicle identification systems; advanced traveler information systems; active traffic management; traffic flow-metering; incident management; GIS technologies and applications; and traffic flow simulation.

|                       |                             |              |
|-----------------------|-----------------------------|--------------|
| <b>GCV554</b>         | <b>Highway Construction</b> | <b>2 cr.</b> |
| <b>Pre-requisites</b> | GCV440                      |              |

Students will be introduced to: project management; health and security at work; construction of tunnels and underground structures; construction of bridges; construction of road structures, pavements, hydraulic structures, and retaining walls; automation in construction; standards and practices in Lebanon.

|                       |                       |              |

| A major project in engineering analysis, design, development or research carried out by individual or groups of students and a faculty research supervisor. The objective is to provide an opportunity to develop initiative, self-reliance, creative ability and engineering judgment. A project proposal, an interim report, and an oral presentation are required.                                                                                                                                                                                                                                                                                                                                                     |                                                   |              |

| This course provides the students with the opportunity to learn how to apply engineering design principles in a major group design project. While working on the projects, the students will learn how to effectively plan, schedule, search for data and information, communicate and cooperate in a team environment.                                                                                                                                                                                                                                                                                                                                                                                                   |                                                   |              |

| This course examines the nature of earthquake ground motion; seismic hazard evaluation in engineering practice; response analysis of structures and effect of soil conditions on structural response and behavior under earthquake ground motion; design of structures under earthquake loading; and an introduction to the UBC, IBC and PS standards                                                                                                                                                                                                                                                                                                                                                                     |                                                   |              |
| <b>CVE601</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>Management and Site Organization</b>           | <b>2 cr.</b> |
| This course considers the responsibilities for planning, organizing, monitoring, controlling and administering groups of staff, e.g. site manager.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                   |              |
| <b>CVE602</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>Urban Planning</b>                             | <b>3 cr.</b> |
| This course presents concepts, methods, and techniques that are used for urban planning and treats the urban area as a system for the purpose of planning infrastructure (e.g., transportation, water supply, and waste water disposal).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                   |              |
| <b>CVE603</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>Bridges</b>                                    | <b>3 cr.</b> |
| This course discusses: types of bridges; influence lines; loads and their distribution on bridges; serviceability of bridges; and methods of design of bridge deck, superstructure, and substructure. Standards and norms (i.e. AASHTO) are also included.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                   |              |
| <b>CVE604</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>Pavement Analysis, Design, and Maintenance</b> | <b>3 cr.</b> |
| Students will be introduced to: traffic analysis, environmental conditions, soil and drainage; material characterization and mix design; structural design; maintenance and rehabilitation; pavement monitoring; and pavement management systems.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                   |              |
| <b>CVE605</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>Special Structures</b>                         | <b>2 cr.</b> |
| Special structures are true three-dimensional representations of our equilibrium equations and affirmations of our analytical techniques, design standards and construction practices. They include many types of structures, such as: space frames or grids; cable-and-strut and tensegrity, self-erecting and deployable; cable net; tension membrane; lightweight geodesic domes; folded plates; and thin shells.                                                                                                                                                                                                                                                                                                      |                                                   |              |
| <b>CVE606</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>Offshore Structures</b>                        | <b>2 cr.</b> |
| Students will learn about: the design of offshore platforms (introduction, fixed and floating platforms); case studies and general features (elements of hydrodynamics and wave theory) - fluid structure interaction; steel, concrete and hybrid platforms; design criteria; environmental loading (wind, wave and current loads after installation); stability during towing; foundations (site investigations); piled foundations; foundations for gravity structures; behavior under dynamic loading; static and dynamic analysis of platforms and components; dynamic response in deterministic and indeterminate environment; codes of practice; and analysis of fixed platform and semisubmersible related topics. |                                                   |              |
| <b>CVE607</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>Highway and Road Design</b>                    | <b>3 cr.</b> |
| This course examines: the contemporary road design approach; the speed parameter; design consistency; 3-D design controls; esthetic road design criteria; energy and environmental impacts of highway design; design for heavy vehicles and powered two wheelers; at-grade unsignalized intersections; roundabouts; interchanges; and standards and practices in Lebanon.                                                                                                                                                                                                                                                                                                                                                 |                                                   |              |
| <b>CVE608</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>Highway Construction</b>                       | <b>2 cr.</b> |
| Students will be introduced to: project management; health and safety at work; construction of tunnels and underground structures; construction of bridges; construction of road structure, pavements, hydraulic structures, and retaining walls; automation in construction; and standards and practices in Lebanon.                                                                                                                                                                                                                                                                                                                                                                                                     |                                                   |              |
| <b>CVE610</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>Prestressed Concrete</b>                       | <b>2 cr.</b> |
| This course describes the design methods and the material characteristics of the prestressed elements; prestress losses; working strength design procedures; composite construction; ultimate flexural strength and behavior; shear design; and continuous prestressed concrete members. There will also be a case study/project.                                                                                                                                                                                                                                                                                                                                                                                         |                                                   |              |
| <b>CVE611</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>Advanced Structural Analysis</b>               | <b>3 cr.</b> |
| This course covers the analysis of statically indeterminate structures by flexibility (force) and stiffness methods; an introduction to the direct stiffness method, Cross method; influence lines for indeterminate structures; computer structural analysis applications; project building modeling and assessment; and an introduction to the non-linear analysis, P-D analysis.                                                                                                                                                                                                                                                                                                                                       |                                                   |              |
| <b>CVE612</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>Sustainable Construction</b>                   | <b>3 cr.</b> |
| The aim of this course is to provide an introduction to the principles of green building, including water, energy, resource efficiency, and waste reduction. It also looks at how to implement greenhouse gas emission management principles, such as emission reduction goals, accounting techniques and standards, and comprehensive emissions reduction plans and evaluation of the building performance according to LEED standards. The students will be able to analyze energy audits, conservation measures, codes and standards, and daylight simulation/modeling tools for various building types.                                                                                                               |                                                   |              |
| <b>CVE613</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>Steel and Mixed Structures</b>                 | <b>3 cr.</b> |
| This course examines: loads on structures; philosophies of design (LRFD versus ASD); behavior, analysis, and design (according to AISC) of tension members; bolted connections; welded connections; compression members; and beams. An introduction to composite section and mixed structure design is also given.                                                                                                                                                                                                                                                                                                                                                                                                        |                                                   |              |
| <b>CVE614</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>MEP Systems</b>                                | <b>2 cr.</b> |
| This course will allow students to learn about Mechanical, Electrical, Plumbing, and Fire (MEP) systems in buildings. It is required for special coordination and planning to minimize delays and interferences. This course will enable students to understand these systems and also to schedule, estimate and coordinate them within the general construction process.                                                                                                                                                                                                                                                                                                                                                 |                                                   |              |
| <b>CVE615</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>Finishing</b>                                  | <b>2 cr.</b> |

Finishing and materials introduces the building materials and finishes used in interior and exterior applications in the context of their environmental impact, their implications for human health and safety, and their potential contribution to the design of architectural elements. This course teaches students to explore the diversity of interior building and finish materials, and provide the technical vocabulary and scientific concepts associated with procedures used for their fabrication, testing and evaluation.

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                  |              |

| This course provides the common rules to be applied in order to achieve a successful building project. Coordination between different disciplines will be attempted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                  |              |
| <b>CVE620</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>Underground Structures</b>                                    | <b>2 cr.</b> |
| This course covers: an introduction to tunneling with its geological aspects; tunneling methods in soft and rock ground; drilling and blasting; ground treatment in tunneling; design and supports; rock reinforcement, concrete and shotcrete linings.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                  |              |
| <b>CVE621</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>Hydrogeology</b>                                              | <b>2 cr.</b> |
| This course will provide a basic understanding of the physical and chemical aspects of hydrogeology. The emphasis will be on low temperature groundwater and groundwater-surface water systems. This course includes information on hydrogeology of geothermal systems and volcanoes. This course will address the occurrence, movement, and reactions of water within the earth's subsurface. We will emphasize the evaluation of flow directions and rates, calculation of hydraulic properties, and processes controlling the composition of ground water.                                                                                                                                                                      |                                                                  |              |
| <b>CVE622</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>Rock Mechanics</b>                                            | <b>3 cr.</b> |
| This course provides general analytical tools and experimental methods that are used in rock mechanics. Theoretical topics covered in the lectures include: fundamental concepts of stresses and strains, linear elastic constitutive model of rocks, failure modes and models of rocks, fracture mechanisms and models of rocks, inelastic behavior of rocks, and seismic waves.                                                                                                                                                                                                                                                                                                                                                  |                                                                  |              |
| <b>CVE623</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>Geographic Information Systems</b>                            | <b>2 cr.</b> |
| This is an introductory course on Geographic Information Systems (GIS) and their applications in the planning and engineering fields, alternatives in computer-based graphics, data concepts and tools, network data management and planning applications, and implementation issues. This course satisfies the departmental requirements in all graduate engineering programs.                                                                                                                                                                                                                                                                                                                                                    |                                                                  |              |
| <b>CVE624</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>Soil Dynamics</b>                                             | <b>3 cr.</b> |
| Students will study: the geotechnical considerations of earthquake engineering and foundation vibrations; seismic surveying; ground motion during earthquakes; determination of soil properties for ground response analysis; dynamic properties of soils; soil structure interaction effects; soil liquefaction; dynamic analysis of earth dams; settlements resulting from earthquakes; lateral earth pressures during earthquakes; and foundation vibrations.                                                                                                                                                                                                                                                                   |                                                                  |              |
| <b>CVE625</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>Slope Stability, Excavation and Shoring</b>                   | <b>3 cr.</b> |
| Students will learn about: the design and construction of earth and rockfill dams; seepage problems, flow nets, seepage control, soil compaction and stabilization; computer analysis of slope stability, factor of safety; and measures taken to limit and accommodate settlements.                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                  |              |
| <b>CVE626</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>Geotechnics of Roads</b>                                      | <b>3 cr.</b> |
| This course covers advanced techniques in geomechanics, subsurface exploration and soil investigation for roads, and ground improvement techniques under roads.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                  |              |
| <b>CVE630</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>Hydraulic Structures</b>                                      | <b>2 cr.</b> |
| This course covers closed conduit flow, water distribution systems, transient analysis, open channel flow, flood control, culvert hydraulics, and design of various hydraulic structures.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                  |              |
| <b>CVE631</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>Waste Water Treatment</b>                                     | <b>3 cr.</b> |
| A course that examines the quality and treatment methods of water and wastewater, and testing for physical, chemical, and biological parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                  |              |
| <b>CVE632</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>Management and Economy of Water</b>                           | <b>3 cr.</b> |
| This course provides an introduction to water resource management challenges and the many complex factors that contribute to them. Some topics that will be discussed are: water supply concerns given population growth and increasing demand, uncertainty in light of climate change, water quality issues stemming from point and nonpoint sources of pollution and from a lack of sanitation, and the geopolitics surrounding bulk water exports and sharing trans-boundary waters.                                                                                                                                                                                                                                            |                                                                  |              |
| Approaches for addressing water-related issues will be explored, including conceptual frameworks like Integrated Water Resource Management (IWRM) and the human right to water, and management tools like pricing and privatization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                  |              |
| <b>CVE633</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>Irrigation Networks</b>                                       | <b>3 cr.</b> |
| This course will introduce students to: source materials for irrigation projects (hydrological, climatic, geological and hydro-geological); preparation of irrigation constructions (standardization, construction documentation); investment goal; preparation documentation, projecting task; documentation of real type of constructions; projecting of soil unit; proposal of irrigation detail (proposal of water distribution, its flow capacity and dimension of pipe network); application of linear programming for optimization of pipe network; reviewing of irrigation equipment characteristics from viewpoint of suitability for plants and soil; and drawing documentation of operational project, its realization. |                                                                  |              |
| <b>CVE634</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>Urban Hydraulics</b>                                          | <b>3 cr.</b> |
| The aim of the course is to study the hydrology and drainage requirements of urban areas. Throughout the course, we introduce the effects of urbanization on the hydrological cycle; develop basic methods of hydrological analysis including rainfall-runoff models and flood frequency analysis. We review the basics of rainfall analysis and hydraulics, and apply this to storm, foul and combined sewer design. We explore sewer flow and quality models, storm water management and the increasing influence of sustainability principles.                                                                                                                                                                                  |                                                                  |              |
| <b>CVE640</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>Transportation Systems and Traffic Analysis</b>               | <b>3 cr.</b> |
| Students will learn about: transportation planning; the four step method; discrete choice models in transportation systems analysis; intermodal transport; freight and logistics; project evaluation and cost-benefit analysis; traffic flow characteristics; traffic flow models; highway capacity and level of service.                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                  |              |
| <b>CVE641</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>Statistical Methods for Transportation Data Analysis</b>      | <b>2 cr.</b> |
| The course explains: data management and data editing; descriptive and exploratory statistics; probability models and statistical inference; multivariate statistics; and statistical learning methods.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                  |              |
| <b>CVE642</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>Traffic Management Systems</b>                                | <b>3 cr.</b> |

The course contents are: an introduction to Intelligent Transportation Systems; traffic surveillance methods; automatic vehicle identification systems; advanced traveler information systems; active traffic management; traffic flow-metering; incident management; GIS technologies and applications; and traffic flow simulation.

**CVE643 Highway Safety 3 cr.**  
The course covers these essential topics: safety issues in the Mediterranean area; the role of the driver-vehicle-road-environment system in highway safety; crash data; safety performance functions; the empirical Bayes method; crash modification factors; safety performance based highway design; network screening; diagnosis; selection of countermeasures; economic appraisal and prioritization; road safety impact assessment; road safety audits; road safety inspections; and network safety management based on road safety inspections.

**CVE691 Thesis I 1 cr.**  
**CVE692 Thesis II 5 cr.**  
**Pre-requisites CVE691**

**GEL211 Electric Circuits 3 cr.**  
**Co-requisites GEL271 And MAT227**

This course presents the basics of electric circuits' analysis: introduction to theory, circuit variables and elements (dependent and independent voltage and current sources, resistors, inductors, capacitors); basic analysis and design of resistive circuits and different analysis techniques (Node-Voltage analysis, Mesh-Current analysis, source transformations, Thevenin's and Norton's equivalent, maximum power transfer, and Superposition methods); an introduction to capacitance, inductance, and mutual inductance; current-voltage relation; RC, RL and RLC circuits analysis (natural and step responses). Topics also include ideal operational amplifiers circuit simplification, steady-state and transient analysis, phasors, frequency response, Kirchhoff's laws and Thevenin's and Norton's equivalent represented in the frequency domain, Laplace transform and an introduction to Transfer functions.

**GEL271 Electric Circuits Lab 1 cr.**  
**Co-requisites GEL211**

Introduction to the laboratory devices. Introduction to Pspice (simulation software). Simple electric circuits like voltage and current-divider and resistance measurements are implemented and analyzed. Then, students are faced to Thevenin's theorem and Norton equivalent circuit. Ideal Operational Amplifier circuits like the inverting, non-inverting, integrator ... are also studied. The Bode and phase diagrams of first order passive filters are determined and simulated. Finally, the Kirchoff's law in the frequency domain and Thevenin theorem and power measurement are done.

**GEL311 Logic Design 3 cr.**  
**Pre-requisites GIN221**

The Logic Design course is the first course in the fundamentals of digital systems for the students majoring in computer/electrical/biomedical/telecom engineering. This is a core course and a pre-requisite for higher level courses in the areas of digital systems, digital communications, and digital control.

This course introduces students to the basic concepts of combinational digital circuits, including analysis and design. We begin by covering the mathematical concepts necessary in the study of digital systems. We will then move onto studying digital gates and how they work. We will design and analyse combinational circuits and show how to construct the minimal (least number of gates) circuit necessary to implement a specific Boolean function.

Topics covered: Binary number systems, number representations, and codes. Boolean algebra. Boolean functions. Logic gates and circuits. Logic simplification using Boolean algebra and Karnaugh maps. Combinational logic design and building blocks. VHDL programming. Digital Logic Families.

**GEL312 Electric Power Systems 3 cr.**  
**Pre-requisites GEL211**

This course introduces the concepts of sinusoidal steady-state analysis. Then, a frequency analysis of RLC resonant circuits is performed. For balanced three-phase electric circuit analysis, current, voltage, and power, as well as power factor compensation, are calculated. The Per-Unit System and harmonics in Three-Phase Systems are also explained. Then, special cases of unbalanced three-phase electric circuits are studied with the method of symmetrical components. Finally, an overview of magnetic theory is presented in order to explain the single-phase transformer and to calculate the elements of its electrical model

**GEL313 Electronics 3 cr.**  
**Pre-requisites GEL211**  
**Co-requisites GEL371**

This course begins with an introduction of the physics of semiconductors and of the p-type and n-type semiconductors. Then, we introduce the PN junction, the diode, the Zener diode, their equivalent electrical models and their applications (rectifying circuits, limiting and clamping circuits, voltage regulators, etc.). The second part of this course examines the bipolar transistors in both NPN and PNP configurations. We define the different functioning modes (blocked, linear and saturated) and then we study the DC aspect of these transistors considering different biasing circuits. Afterwards, we do an AC analysis of the BJT amplifier circuits studying the small signal models, the current gain, the voltage gain, the input and output impedances. We finally study all three amplification configurations in common base, common emitter and common collector as well as in multi-stage amplifiers. The last part of this course addresses the subject of MOSFET transistors (the p-channel and the n-channel, depletion-type and enrichment-type), defining different functioning modes and their corresponding models in DC and in small signals.

**GEL314 Digital Electronics 2 cr.**  
**Pre-requisites GEL311**  
**Co-requisites GEL372**

Students will study: the design and implementation of sequential systems (Moore and Mealy machine); Finite State Machine (FSM); digital integrated circuits; an introduction to programmable logic elements (ROM, PAL and PLA); an introduction to the different types of memory (RAM, ROM); and the analog to digital and digital to analog conversion method and its applications.

**GEL320 Analog and Digital Electronics Circuit 3 cr.**  
**Pre-requisites GEL211 and GIN221**

This course introduces the fundamentals of electronics to non-majors: it treats the basic concepts of electronic components and introduces the student to the basic analog and digital electronic circuits. The course covers the fundamentals of semiconductor, p-n junction and Zener diodes,

transistors, combinational and sequential digital systems, as well as basic instrumentation. At the end of the course, students work in teams to implement a digital system.

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                    |              |

| <b>Pre-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | GEL211                                             |              |
| The objective of the practical work of this course is to initiate students to technical drawing and to the use of AutoCAD software. It is a first-time course about learning fundamentals sufficient enough to achieve reading and composing technical drawings in 2D and 3D. Students are initiated to perform free hand sketching, multiviews, section views, and building architecture drawing. In addition, students are introduced to advanced CAD software like AutoCAD Electrical and Revit.                                                                                                                                                                                                                                                               |                                                    |              |

| First, we remind the students of the measuring devices and we introduce Multisim software. Then, students study the characteristics of different types of diodes and circuits. The characteristics of the bipolar junction transistor and the phototransistor are elaborated as well as the characteristics of the FET and MOSFET. Different configurations of transistor-based circuits are also analyzed. The work is simulated with Multisim and an electronic project ends the course.                                                                                                                                                                                                                                                                        |                                                    |              |

| <b>Pre-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | GEL312                                             |              |
| The course introduces first PSim software, then the RLC resonant circuits. Single-phase circuits are implemented: currents, voltages, powers, power factors are measured and simulated. Boucherot Theorem and power factor compensation are applied. Balanced three-phase circuits are then analyzed and simulated along with the Two-Wattmeter method and Delta-To-Wye transformation. Unbalanced three-phase circuits are also studied, measured and simulated with PSIM software. Determination of the elements of the equivalent circuit model of a single-phase transformer is also applied.                                                                                                                                                                 |                                                    |              |

| Many devices require the use of electrical energy in various forms, hence the need for electrical power converters. After a short introduction to power electronics, basic electronic components are explained (diodes, transistors, thyristors). A recall of periodic non-sinusoidal signals and mathematical approach of circuits is performed. Different types of converters are studied: converters AC/DC (rectifiers), DC/AC (inverter), AC/AC (AC voltage controller), and DC/DC (choppers). Studies of the desired outputs of these circuits as well as undesired components such as harmonics and ripple are made.                                                                                                                                        |                                                    |              |

| This course is designed to provide the student with the fundamental principles of the control of dynamical systems. It covers the following topics: Linear system modelling (electrical systems, mechanical systems, electro-mechanical systems), transfer function and state space modelling; time response of first order and second order linear systems and error calculation; Frequency response, Bode and Nichols diagrams, Nyquist diagram; System stability technics (Routh, Nyquist, placement of poles and zeros of the closed loop); Root locus analysis; System behaviour in frequency domain (phase and gain margins, robustness); Correction of linear systems, P, PI, PD and PID corrections; lead and lag correctors, correction via state space. |                                                    |              |

This course is an initiation to electric design. The students will be introduced to the basic electric systems installed in a building: lighting, power, earthing, lightning protection. By the end of the course, the students will be able to implement these systems in a typical apartment and/or office area.

|                       |                                          |              |

| <b>GEL441</b>         | <b>Electrical Instrumentation Design</b> | <b>3 cr.</b> |
| <b>Pre-requisites</b> | GEL314 And GEL313                        |              |
| <b>Co-requisites</b>  | GEL475                                   |              |

The aim of this course is to provide working engineers with the necessary skills and knowledge relevant to the process control and instrumentation industry. The students will be able to understand a whole acquisition system, and be able to design a process industry control from the sensor to the actuator.

| <b>GEL445</b>         | <b>Microprocessors</b> | <b>3 cr.</b> |
| <b>Pre-requisites</b> | GEL314                 |              |

This course introduces basic computer architecture and assembly language programming. The Intel 8088 and 8086 microprocessors are considered as a practical example. After describing the software architecture of the microprocessor, the instruction set (assembly language), addressing modes and machine language are then presented. Input/output types and interfaces are then discussed. Interrupts are explained in the last part.

|                       |                            |              |

| <b>Co-requisites</b> | GEL421                              |              |

Many devices require the use of electrical energy in various forms, hence the need for electrical power converters. Different types of converters are studied: converters AC/DC (rectifiers), DC/AC (inverter), AC/AC (AC voltage controller), and DC/DC (choppers). Tests and simulations related to the desired outputs of these circuits as well as undesired components such as harmonics and ripple are made.

| <b>GEL472</b>        | <b>Non Linear Electronics Lab</b> | <b>1 cr.</b> |
| <b>Co-requisites</b> | GEL420                            |              |

We introduce first the linear and non-linear operational amplifiers and we calculate the offset voltage and offset current. Then we implement different types of op amp circuits and we thoroughly study low pass, high pass, band pass and stop pass active filters of different orders. Many other applications are implemented like log and anti-log circuits, comparators, Schmitt trigger, stable and astable multivibrators, oscillators and the Phase-Locked Loop (PLL).

|                       |                              |              |

| <b>Pre-requisites</b> | GEL445                            |              |

The aim of this lab is the practical application of assembly language to program a microprocessor with hardware interfacing. Students begin by exploring the logical architecture of the Intel 8086 processor using the development board and the corresponding software tool and code compiler. Physical architecture is then explored, while interfacing the processor with different Inputs/Outputs using the associated development board.

|                      |                                              |              |

This laboratory introduces the properties of different sensors. Students will learn to use a computer as a measuring instrument for physical quantities such as light, temperature and others. Students will first learn to use LabView as a graphical programming tool. Then, the data acquisition board is introduced. Once familiar with LabView and the acquisition board, students will develop multiple acquisition and monitoring applications in order to measure different physical quantities.

| <b>GEL477</b>         | <b>Linear Control Lab for Electrical Engineers</b> | <b>1 cr.</b> |
| <b>Pre-requisites</b> | GEL425                                             |              |

The main objective of this lab is to experiment different topics given in the linear control system course. A main attention is given to the modelling of electrical systems and electromechanical systems. Matlab, Simulink, and specific hardware are used for implementation. Also, some new topics are introduced as the PID tuning. This lab consists too of an introduction to mechatronics systems.

**GEL480 Internship I 1 cr.**

**Pre-requisites** GEL440

In order to register for this course, the students first spend a minimum of two months experience in the industry or a company and live a real experience in the field of practice that they have chosen. Afterwards, the students present their "job" and what they learned from it in a well-structured and well-written scientific report.

**GEL502 Microprocessor Systems 3 cr.**

**Pre-requisites** (GEL410 Or GEL320) And GMC467

**Co-requisites** GEL503

The purpose of this course is providing an introduction to microcontroller families: Motorola, Intel, Microchip. We will be studying the internal resources and programming of Microchip PIC microcontrollers, as well as developing multiple practical applications.

**GEL503 Microprocessor Systems Lab 1 cr.**

**Co-requisites** GEL502

The main objective of this course is to apply different microcontroller topics and peripherals, introduced using the C language, physically. To do so, the PIC24FJ256DA210 Development Board is used along with the MPLAB program to build and make the program. Software Debugging using the ICD3 is also applied.

**GEL504 Sensors and Acquisition Systems 2 cr.**

**Pre-requisites** GEL410

The aim of this course is to provide working engineers with the necessary skills and knowledge relevant to the process control and instrumentation industry. The students will be able to understand a whole acquisition system, and be able to design a process industry control from the sensor to the actuator.

**GEL521 Advanced Command Strategies 2 cr.**

**Pre-requisites** GEL425 Or (GEN428 And GIN321)

In this course we will be studying Neural Network Multi-Layer-Perceptron Network (MLP) and Radial-Basis-Function (RBF) in detail as well as learning algorithms. After, we will describe some of the control methods using neural networks. Then comes the fuzzy logic (principles and fuzzy logic control) and the integration of fuzzy methods in neural networks. Then we study the Kalman and the Wiener-Hopf filters.

**GEL530 Electric Machines 3 cr.**

**Co-requisites** GEL570

This course covers the following: structure and function; magnetic circuit of a DC machine; DC generators (classification and characteristics); DC motors (classification and characteristics); synchronous machines (construction and principle of operation); synchronous generator characteristics; synchronous motor characteristics; asynchronous motor (construction, principle of operation and characteristics).

**GEL531 Generation and Transport of Electrical Energy 3 cr.**

**Pre-requisites** GEL455

This course is designed to provide the student with the fundamental principles of the electric energy production and distribution. Energy production is treated at first. Several types of power stations are presented and compared. The energy transmission lines and distribution systems are studied next along with a review of power transformers and the per-unit system.

**GEL533 Mechatronics 3 cr.**

**Pre-requisites** GEL441 and GEL450

Mechatronics is a design philosophy involving a complete integration of mechanical engineering, electronics, control theory and computer engineering in order to design a product. It is based on an interdisciplinary approach involving many disciplines concurrently and allowing flexibility and adaptability by replacing some mechanical functions by electronic processing. After introducing basic elements of a mechatronic system, the course presents methods of modelling, analyzing and controlling engineering systems based on modern technologies and allowing the students to follow an interdisciplinary approach starting from the earliest stages of the design.

**GEL536 Industrial Maintenance 2 cr.**

**Pre-requisites** GEL455

In recent years, industrial maintenance has seen many significant advances, due to a number of factors, such as sophisticated equipment, and severity norms on safety and security equipment. This course is designed to provide the students with the fundamental principles of industrial maintenance, and it covers the following topics: maintenance function, system failures, corrective and preventive maintenance, dependence, cost reliability, organization and control.

**GEL537 Advanced Electrical Installation Design 2 cr.**

**Pre-requisites** GEL440

This course is in continuity with the previous course GEL440 Electrical Installations. It covers the following systems: phone systems, data, fire systems, intrusion, videophone, video monitoring, access control, distribution TV systems, sound systems, and home automation systems.

**GEL538 Machines Diagnosis Methods 3 cr.**

**Pre-requisites** GEL455 And GEL421 And GRT410

This course is designed to present the methods of electrical machines diagnosis in industry, and it covers the following topics: faults of rotating machines and their diagnostics; modelling the faults of stator, rotor and winding in the electrical machine; close loop diagnosis of an asynchronous machine; observer based fault diagnosis; thermal supervision of rotating machines (asynchronous machine); and diagnosis using neural network methods. Each method will be described and presented with an application.

**GEL539 Renewable Energy 3 cr.**

**Pre-requisites** GEL455

**Co-requisites** GEL573

The course introduces the different sources of renewable energy: solar energy, wind energy, water energy, biomass energy. It also provides the fundamental concepts of power grid and microgrid integration using green energy sources. For each application, exercises and design problems are

given throughout the course. Students' oral presentations also play a major role in understanding contemporary issues and the impact of engineering solutions in a global, economic, environmental, and societal context.

**GEL550 Applied Digital Systems Design Techniques 3 cr.**  
**Pre-requisites** GEL314 and GEL372

This class presents a systematic approach to designing and implementing chip-level digital systems design. The class places emphasis on simulation and CAD tools. The skills acquired include high-level hardware design languages, digital simulation tools, synthesizers, power analysis and chip planning tools.

The class is practical and allows students to learn by doing. Students will work in teams to execute and demonstrate their project, and at the end of which period they will showcase their work by giving a professional presentation to an open audience of faculty, fellow students, and interested companies.

Full process and development cycle will address all the issues that are typically faced in the process of developing a digital design.

**GEL552 Robotics 3 cr.**  
**Pre-requisites** GEL425

By the end of this course the students must be able to imagine and describe the motion of any robot. They will learn the skills to be able to analyze the velocities, singularities and force transmissions involved.

**GEL553 Robotics 3 cr.**  
**Pre-requisites** GEL455 or GEL430

By the end of this course the students must be able to imagine and describe the motion of any robot. They will learn the skills to be able to analyze the velocities, singularities and force transmissions involved.

**GEL556 Advanced Control 3 cr.**  
**Pre-requisites** GEL425

**Co-requisites** GEL574

The purpose of this course is providing an in-depth study of the numerical control of sampled systems, including a detailed study of non-linear systems.

**GEL558 Microcontrollers 3 cr.**  
**Pre-requisites** GEL445 and GIN231

**Co-requisites** GEL575

The purpose of this course is to provide an introduction to microcontroller families: Motorola, Intel, Microchip. We will be studying the internal resources and programming of Microchip PIC microcontrollers, as well as developing multiple practical applications.

**GEL559 Microcontrollers 3 cr.**  
**Co-requisites** GEL577

The purpose of this course is to provide an introduction to microcontroller families: Motorola, Intel, Microchip. We will be studying the internal resources and programming of Microchip PIC microcontrollers, as well as developing multiple practical applications.

**GEL560 Industrial Programming 2 cr.**  
**Pre-requisites** GEL558 and GIN231

**Co-requisites** GEL572

In this course, we will study PLCs in detail as well as how to use them and their programming methods. A detailed study of Grafset, Ladder and Programmable Controllers will be presented. Then we familiarize students with the fieldbus CAN, I2C, MODBUS and Ethernet Industrial.

**GEL570 Electric Machines Lab 1 cr.**  
**Co-requisites** GEL530

The aim of the practical work is the implementation of the various theoretical concepts learned in the course. Simulation problems and practical examples will be studied.

**GEL572 Industrial Programming Lab 1 cr.**  
**Co-requisites** GEL560

This lab covers: IEC 61131-3 programming using Beckhoff's TwinCAT (System Manager, PLC control and ADS); the development of Human Machine interfaces; and the application to power measurement, stepper motors and servomotors.

**GEL573 Renewable Energy Lab 1 cr.**  
**Co-requisites** GEL539

In this laboratory, students will learn the sizing, the installation, the characteristics, and the optimum design of each renewable energy source and system. We will focus on photovoltaic panels, solar water heaters, wind turbines, and fuel cells.

**GEL574 Advanced Control Lab 1 cr.**  
**Pre-requisites** GEL556 and GEL477

The main objective of this lab is to experiment topics learned in the advanced control one using Matlab and Simulink. Also, some new topics are introduced as the calculation of the PID controller, hardware implementation.

**GEL575 Microcontrollers Lab 1 cr.**  
**Co-requisites** GEL558 and GEL474

The main objective of this course is to apply different microcontroller topics and peripherals, introduced using the C language, physically. To do so, the PIC24FJ256DA210 Development Board is used along with the MPLAB program to build and make the program. Software Debugging using the ICD3 is also applied.

**GEL577 Microcontrollers Lab 1 cr.**  
**Co-requisites** GEL559

The main objective of this course is to apply different microcontroller topics and peripherals, introduced using the C language, physically. To do so, the PIC24FJ256DA210 Development Board is used along with the MPLAB program to build and make the program. Software Debugging using the ICD3 is also applied.

**GEL581 Internship II 1 cr.**  
**Pre-requisites** GEL596

In order to register for this course, the students first spend a minimum of two months experience in the industry or a company and live a real practical experience in the field of practice that they have chosen. Afterwards, the students present their “job” and what they learned from it in a well-structured and well-written scientific report.

**GEL596 Final Project I 1 cr.**

This course pushes the student to demonstrate his readiness to start his career as a professional engineer by undertaking an investigation of a capstone design project relevant to the profession and by appraising its practical experience.

The capstone design project will give the student the opportunity to marshal the relevant knowledge and skills from various courses and laboratories of the program and apply them in order to propose or develop a proposal of an approved design project and then produce a report of professional standard detailing the steps of achieving the proposed project.

**GEL597 Final Project II 3 cr.**  
**Pre-requisites** GEL596

This course pushes the student to demonstrate his readiness to start his career as a professional engineer by undertaking an investigation of a capstone design project relevant to the profession and by appraising its practical experience.

The capstone design project will give the student the opportunity to marshal the relevant knowledge and skills from various courses and laboratories of the program and apply them in order to propose or develop a proposal of an approved design project and then produce a report of professional standard detailing the steps of achieving the proposed project.

**GEL600 Special Topic in Electrical and Electronics Engineering 3 cr.**

**GEL620 Advanced Control 3 cr.**

**Pre-requisites** GRT561 Or GEL510

**Co-requisites** GEL671

The purpose of this course is to provide an in-depth study of the numerical control of sampled systems, including a detailed study of nonlinear systems with Microcontroller Based Applications.

**GEL621 Advanced Command Strategies 2 cr.**

In this course we will be studying neural networks using the Multi-Layer-Perceptron Network (MLP) and Radial-Basis-Function (RBF) in detail, as well as Learning Algorithm. After, we will describe some of the control methods using neural networks. Then comes the fuzzy logic (principles and fuzzy logic control) and the integration of fuzzy methods in neural networks. Then we study the Kalman and the WienerHopf filters.

**GEL622 Industrial Programming 2 cr.**

**Pre-requisites** GEL559

**Co-requisites** GEL672

In this course, we will study PLCs in detail as well as how to use them and their programming methods. A detailed study of Grafset, Ladder and Programmable Controllers will be presented. After we familiarize students with the fieldbus CAN, I2C, MODBUS and Ethernet Industrial.

**GEL631 Generation and Transport of Electrical Energy 3 cr.**

**Pre-requisites** GEL554

This course is designed to provide the student with the fundamental principles of the electric energy production and distribution. Energy production is treated at first. Several types of power stations are presented and compared. The energy transmission lines and distribution systems are studied next along with a review of power transformers and the per-unit system.

**GEL632 Renewable Energy 3 cr.**

**Pre-requisites** GEL554

**Co-requisites** GEL673

The course introduces the different sources of renewable energy: solar energy, wind energy, water energy, biomass energy. It also provides the fundamental concepts of power grid and microgrid integration using green energy sources. For each application, exercises and design problems are given throughout the course. Students’ oral presentations play a major role in understanding contemporary issues and the impact of engineering solutions in a global, economic, environmental, and societal context.

**GEL633 Mechatronics 3 cr.**

**Pre-requisites** GEL554

Mechatronics is a design philosophy involving a complete integration of mechanical engineering, electronics, control theory and computer engineering in order to design a product. It is based on an interdisciplinary approach involving many disciplines concurrently and allowing flexibility and adaptability by replacing some mechanical functions by electronic processing. After introducing basic elements of a mechatronic system, the course presents methods of modelling, analyzing and controlling engineering systems based on modern technologies and allowing the students to follow an interdisciplinary approach starting from the earliest stages of the design.

**GEL636 Industrial Maintenance 2 cr.**

In recent years, industrial maintenance has seen many significant advances. This is due to many factors, including sophisticated equipment and severity norms on safety and security equipment. This course is designed to provide students with the fundamental principles of industrial maintenance, and it covers the following topics: maintenance function, system failures, corrective and preventive maintenance, dependently, cost reliability, organization and control.)

**GEL638 Machines Diagnosis Methods 3 cr.**

**Pre-requisites** GEL554 And GRT561

This course is designed to present the methods of electrical machines diagnosis in the industries. It covers the following topics: faults of rotating machines and their diagnostics; modelling the faults of stator, rotor and winding in the electrical machine; closed loop diagnosis of asynchronous machine; observer based fault diagnosis; thermal supervision of rotating machines (asynchronous machine); and diagnosis using neural network methods. Each method will be described and presented with an application.

**GEL642 Microprocessor Systems 3 cr.**

**Co-requisites** GEL677

The purpose of this course is to provide an introduction to microcontroller families: Motorola, Intel, Microchip. We will be studying the internal resources and programming of Microchip PIC microcontrollers, as well as developing multiple practical applications.

**GEL671 Advanced Control Lab 1 cr.**

**Co-requisites** GEL620

The main objective of this lab is to experiment topics learned in the advanced control one using Matlab and Simulink. Also, some new topics are introduced as the calculation of the PID controller, hardware implementation.

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                      |              |

| In this laboratory, students will learn the sizing, the installation, the characteristics, and the optimum design of each renewable energy source and system. We will focus on photovoltaic panels, solar water heaters, wind turbines, and fuel cells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                      |              |

| <b>Co-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | GEL642                                               |              |
| The main objective of this course is to apply different microcontroller topics and peripherals, introduced using the C language, physically. To do so, the PIC24FJ256DA210 Development Board is used along with the MPLAB program to build and make the program. Software Debugging using the ICD3 is also applied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                      |              |
| <b>GEL691</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>Thesis I</b>                                      | <b>1 cr.</b> |
| This course pushes the students to demonstrate readiness to start their careers as professional engineers by undertaking an investigation of a research topic relevant to the profession and by appraising its practical experience. The research topic and applied developed product or study will give the students the opportunity to marshal the relevant knowledge and skills from various courses and laboratories of the program and apply them to investigate an approved research topic and then produce a report of professional standard. This course requires the students to exhibit/develop a proactive approach to manage, orient and present a project.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                      |              |

| <b>Co-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | GEN270                                               |              |
| The course covers principles and concepts of relativity, quantum mechanics and their applications. The following topics will be covered along with their applications: the failure of classical physics; the special theory of relativity; the particle properties of electromagnetic radiation; the wave properties of particles; the Schrödinger equation; the Rutherford-Bohr model of the atom and the hydrogen atom in wave mechanics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                      |              |

| Tell me, I'll forget. Show me, I may remember. But, involve me, and I'll understand. Chinese proverb. The laws of physics are based on experimental and observational facts. Laboratory work is therefore an important part of a course in general physics, helping students develop skills in fundamental scientific measurements and increasing understanding of the physical concepts. It is valuable for students to experience the difficulties of making quantitative measurements in the real world and to learn how to record and process experimental data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                      |              |

| This course is designed to give students the opportunity to enhance their writing abilities and develop their critical thinking. It is also designed to provide rigorous training in advanced reading, critiquing, synthesizing and researching. It attempts to help students achieve greater competency in reading, writing, reflection, and discussion, emphasizing the responsibilities of written inquiry and structured reasoning. Students are expected to investigate questions that are at issue for themselves and their audience and for which they do not already have answers. In other words, this course should help students write about what they have learned through their research rather than simply write an argument supporting one side of an issue or another. In addition, students deliver one oral power point presentation based on their writings.                                                                                                                                                                                                                                                                                                                                                                                        |                                                      |              |
| <b>GEN301</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>Law for Engineers</b>                             | <b>2 cr.</b> |
| This course is designed to provide students with fundamental knowledge of legal principles and terminology, to understand the basic foundations and theories of law, and to explain the legal concepts and terminology in substantive areas of law (i.e., Contract Law, Liability Law, Labor Law, Commercial Law, etc.) It is also designed to help prepare engineering students for careers in fields which are impacted by the law and to demonstrate an understanding of the interaction between the fields of law and the application of laws and legal strategy in engineering. This course will also help engineering students to understand their rights and responsibilities as a contractor (application of Contract Law), an employee (application of Labor Law) and as a partner (application of Commercial Law).                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                      |              |

| In all sectors, innovation and entrepreneurship (as a form of innovation) have become an important source of sustainable competitive advantage for firms around the world. However, innovation management and the capability of managers and owners to build innovative organization is quite a challenge. In this course, we will address the role of innovation and entrepreneurship for macro and micro levels and focus on practices and processes to successfully manage it. The course will focus on entrepreneurial firms (start-ups and corporate ventures of established firms) and analyze success and failure cases of innovation. This course provides good grounding in technology and innovation management for students interested in becoming entrepreneurs or managers in innovation driven firms. Students will learn based on lectures, case analysis, external experts and own research and presentations. In innovation management it is impossible to separate organizational strategy from implementation since a great idea will only become an innovation if managers are capable to commercialize and monetize it. Therefore, much of the material discussed and analyzed within the course relates to strategy and organizational behavior. |                                                      |              |

|                       | The main objective of this course is to complete the knowledge of mathematics for the student engineer. It mainly covers the following themes: functions of a complex variable; analytical functions; Cauchy-Riemann conditions; harmonic functions; Cauchy integrals formulae; Taylor series; singular points; inverse Laplace transformation; special functions (Gamma and Beta functions); Bessel function; orthogonal functions (Tchebychev, Legendre, Hermite, Laguerre); and discrete-time Markov Chains.                                                                                                                                                                                                                                                                                                                                                                                                 |              |

|                       | This course covers the basics of project management where students learn what project management involves and how to approach it successfully and why a plan is so important to the success of a project and how to implement risk management successfully in each phase of the project. We define all tools and techniques for planning and controlling. We cover the major subject areas of the topic of quality of project management and provide valuable information. This course is essential for future engineers working in industrial environments needing to gain a recognized qualification within project management. This course prepares students to apply proven methodologies to projects within their individual fields.                                                                                                                                                                       |              |

|                       | The purpose of this course is to provide numerical concepts and methods needed by students to solve different engineering problems. Topics covered include: resolution of non-linear equations; numerical integration; data approximation and interpolation and numerical resolution of differential equations. Many numerical methods are implemented and tested using Matlab software.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |              |
| <b>GEN450</b>         | <b>Finite Element Method</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>3 cr.</b> |
| <b>Pre-requisites</b> | GEN428                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |              |
|                       | The objective of this course is to analyze real world structural mechanics problems using the finite element method. The mathematical roots of FEA will be covered extensively in this course, on which nearly all structural analysis software is built. The course will provide for the specific challenges of engineers across all mechanical disciplines (aerospace, manufacturing, mechanical and mechatronic). Also, this course provides deep insight into the operation of finite element analysis software by training the students to implement a detailed FE study including planning, modelling, meshing, solving, evaluating results and validating against real world data.                                                                                                                                                                                                                       |              |
| <b>GEN499</b>         | <b>Seminars and Conferences</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>0 cr.</b> |
|                       | Each semester, the Faculty of Engineering organizes several seminars and conferences in which leading figures in the professional and academic world target future engineers with a speech presenting scientific, technical, and/or industrial topics, etc. and showing them the various aspects of the engineering profession.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |              |

|                       | The English 516 is designed for students working on their thesis. It gives them the opportunity to enhance their writing abilities and develop their critical thinking. It is designed to provide rigorous training in advanced reading, critiquing, synthesizing and researching. It attempts to help students achieve greater competency in reading, writing, reflection, and discussion emphasizing the responsibilities of written inquiry and structured reasoning. Students are expected to investigate questions that are at issue for themselves and their audience and for which they do not already have answers. In other words, this course should help students write about what they have learned through their research rather than simply write an argument supporting one side of an issue or another. In addition, students deliver one oral powerpoint presentation based on their writings. |              |

|                       | This course introduces the finite element method and presents the need for comprehensive evaluation and checking when interpreting results. It covers basic theory; modelling, meshing and analyzing component models for stresses, deflections, temperatures and vibrations under operating conditions and loads; treatment of boundary conditions and restraints; and examples of good practice for safe and effective application in using ANSYS software.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |              |

|                       | This introductory course in programming enables engineering students to learn the methods of rigorous software development solutions in the object-oriented paradigm. The course is supplemented by laboratory sessions for the application of programming concepts studied in the Eclipse integrated development environment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |              |

|                       | This course emphasizes problem solving, algorithms, and an introduction to object-oriented programming. By the end of this course, students will be able to: break down computational problems into a series of easily managed steps; process data and perform input and output operations on it; implement, test, and debug a designed solution to a problem in Java, Matlab or the C language; and demonstrate a good understanding of libraries and use them for program development.                                                                                                                                                                                                                                                                                                                                                                                                                        |              |

| <b>Pre-requisites</b> | GIN221                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |              |
|                       | The first part of this course introduces some concepts of object-oriented programming as well as recursion as a programming technique. In the second part, the following data structures are studied: static arrays, dynamic arrays, linked lists, stacks, queues and trees. In addition, an introduction to computational complexity is introduced in this course which allows for making a reasonable comparison between the different implementations of the above data structures.                                                                                                                                                                                                                                                                                                                                                                                                                          |              |

|                       | Students will study: the architecture and functions of a DBMS; database design (conceptual model, logical and physical models); the Entity-Relationship model; relational model and integrity constraints; relational algebra; SQL language (Data Definition Language (DDL) and Data Manipulation Language (DML)); functional dependencies, normalization and normal forms; and an introduction to PL/SQL language (triggers, stored procedures and functions). The concepts studied in this course will be applied in dedicated laboratory sessions (GIN371).                                                                                                                                                                                                                                                                                                                                                  |              |

| This course covers fundamental concepts of object-oriented Design and software development. It covers OOP concepts (classes, objects, abstraction, encapsulation, inheritance, polymorphism, dynamic links, inter-classes relations, inter-objects communication; etc.); Analysis and Design Modeling with UML (Requirements determination; functional and non-functional requirements); Business Process and Functional Modeling; Structural Modeling, and Behavioral Modeling ; etc.); and Design patterns (intent, applicability, structure and implementation).                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                       |              |
| <b>GIN321</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>Algorithmics</b>                   | <b>3 cr.</b> |
| <b>Pre-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | GIN231 and GIN311                     |              |
| Students will study: asymptotic notation, time and space complexities; solving recurrences; trees (traversing methods, balanced trees (AVL and red-black trees), heaps); advanced sorting algorithms, methods of linear sort; hashing (open and closed hashing); graphs (traversal in depth-first and breadth-first, finding of spanning trees and shortest paths); Huffman coding.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                       |              |

| This laboratory covers the SQL language: Data Definition Language (DDL) and Data Manipulation Language (DML). Oracle PL/SQL is used to code, test, and implement stored procedures, functions, triggers, and packages. Relational database projects will be built using PL/SQL. A brief overview of other DBMS (MS SQL Server, MS Access, MySQL) is also given.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                       |              |

| The objective of this course is to study the advanced paradigms of database management systems. The content of this course consists of four main parts: the first part introduces advanced concepts of DBMS such as query optimization, concurrency control and recovery; the second part presents the distributed DBMS, detailing the architecture of these systems in order to identify their different types such as client/server DBMS, distributed DBMS, federated DBMS and multi-DBMS, and finally focuses on the fragmentation and data allocation in distributed databases; the third part presents the analytical databases, specifically data warehouses, explaining the difference between online analytical processing (OLAP) and online transactional processing (OLTP), the ETL process (extraction, transformation and loading) of these warehouses and their logical and physical modeling; the fourth part introduces OODBMS and ORDBMS, their creation and manipulation using respectively the OQL and SQL3 languages. |                                       |              |

| The course covers the fundamental concepts of operating systems, emphasizing single-machine systems. These concepts include processes, threads, process synchronization, CPU scheduling, memory management, file and I/O management, and user program execution. Popular operating systems (e.g., UNIX, LINUX, and Windows) are used to illustrate implementation of these concepts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                       |              |

| This course is a presentation of software engineering principles, methodologies and metrics. The topics of software engineering process and quality are presented in an integrative approach, stressing software improvements through measurements of software products and processes. The Unified Modeling Language (UML) is used throughout the course. Topics covered are software development process, domain analysis, object-oriented programming, software reuse, client-server framework, design patterns, user interfaces, dynamic modeling, software architecture, software testing, software quality, risk analysis and cost estimation.                                                                                                                                                                                                                                                                                                                                                                                      |                                       |              |

| This course introduces different families of algorithms that help students to design, analyze, and implement pertinent solutions for classical problems. It includes methods related to number theory, dynamic programming, linear sorting, backtracking, matrix multiplication, string search, and probabilistic algorithms. In addition, this course introduces basic results in calculability: Turing-Church thesis, undecidability, halting problem, P and NP classes, NP-complete and NP-hard problems.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                       |              |
| <b>GIN446</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>Web Programming</b>                | <b>3 cr.</b> |

| This course aims to cover key concepts, technologies and skills in server-side and client-side Web programming, including HTML5, CSS, JavaScript, .Net, PHP and MySQL, session management, as well as XML, DTD and DOM. After the completion of this course, students will be able to develop a Web system using a particular Web programming language with dynamic and interactive contents. Students will learn the Web programming concepts and techniques via lectures, lab sessions and development projects. There will be an oral presentation of all term assignments and a final project demonstration. Students will be judged and graded on preparation and presentation skills as well as content and also on effective writing style and grammatical correctness. Course content changes frequently to incorporate new Internet technologies.                                                                                                                                                                               |                                       |              |

| <b>Pre-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | GIN231                                |              |
| This laboratory allows engineering students to create applications that address real problems. It complements their knowledge with intensive sessions covering event-driven and object-oriented programming. It covers topics such as Rapid Application Development (RAD), Create-Read-                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                       |              |

Update-Delete (CRUD) development and Graphical User Interface (GUI). The technologies covered are Visual Basic.net, Windows platform, and the development environment is MS Visual Studio.

| <b>Pre-requisites</b> | GIN231 and MAT307 and STA307 | <b>Pre-requisites</b> |

This course provides a solid introduction to the world of artificial intelligence. Students will learn the theory behind Neural Networks and master fundamentals of Neural Networks (NN), Convolutional Neural Networks (CNN), Recurrent Neural Networks (RNN and LSTM), and Generative Adversarial Networks (GAN). Examples on each kind of network are presented in class and the role and importance of the different hyperparameters are discussed. Skills acquired by the students are mainly assessed based on a minimum of 4 projects (1 project for each type of neural networks).

|-----------------------|--------|

The purpose of this course is to introduce the principles of security in fixed and mobile networks. The course starts with an introduction to information security concepts, security services and security mechanisms. In the second part, we discuss the concepts of symmetric and asymmetric cryptography, the hash function and the signature and key sharing procedures and we apply these concepts to secure the data communication using the SSL and the IPSec protocols. In the third part, we discuss security in wireless networks, intrusions and filtering mechanisms through the use of firewalls. Finally, we discuss security management and risk management concepts.

|-----------------------|--------|
| <b>Pre-requisites</b> | GRT431 |
|-----------------------|--------|

The objective of this course is to explain the principles of distributed systems and their different hardware and software architectures. The concepts discussed are: C/S and P2P architectures, inter-process communication, distributed file system, sockets programming, calling procedures and methods remotely (RPC and RMI), CORBA architecture, time synchronization in distributed systems, logical time, coordination algorithms, mutual exclusion, cloud computing, grid computing, clusters, and an introduction to parallel programming.

|               |                                   |              |

| <b>Pre-requisites</b> | GIN446 Or GIN473 |
|-----------------------|------------------|

This course focuses on research and projects in the area of programming mobile devices with an emphasis on the Android platform. The main themes of the course revolve around the design of applications for mobile devices with unique challenges: user interface, mobile-specific technologies, and the importance of performance. Android SDK has its own interesting aspects to learn: the multi-touch model, accelerometer, and other important API receive significant attention. Students will learn the concepts of development applicable to any type of mobile environment: iOS, BlackBerry, Symbian, Windows Phone.

|----------------------|--------|

The objective of this course is to study the advanced paradigms of database management systems. The content of this course consists of four main parts. The first part introduces advanced concepts of DBMS such as query optimization, concurrency control and recovery. The second part presents the distributed DBMS. It details the architecture of these systems in order to identify their different types such as client/server DBMS, distributed DBMS, federated DBMS and multi-DBMS. It finally focuses on the fragmentation and data allocation in distributed databases. The third part presents the analytical databases, specifically data warehouses. It explains the difference between the online analytical processing (OLAP) and online transactional processing (OLTP), the ETL process (extraction, transformation and loading) of these warehouses and their logical and physical modeling. The fourth part introduces OODBMS and ORDBMS, their creation and manipulation using respectively the OQL and SQL3 languages.

|               |                                      |              |

In order to register for this course, the students first spend a minimum of two months experience in the industry or a company and live a real practical experience in the field of practice that they have chosen. Afterwards, the students present their “job” and what they learned from it in a well-structured and well-written scientific report.

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                        |              |

| This course pushes the students to demonstrate readiness to start their careers as professional engineers by undertaking an investigation of a research topic relevant to the profession and by appraising its practical experience. The research topic will give the students the opportunity to marshal the relevant knowledge and skills from various courses and laboratories of the program and apply them to investigate an approved research topic and then produce a report of professional standard.                                                                                                                                                                                                                                                                 |                                                        |              |

| This course covers one or more contemporary topic(s) in Computer Engineering and related areas. It expands the regular curriculum of the MS in Computer Engineering program with specialized skills and knowledge in modern subjects in the field. This course can be replaced by an approved master-level engineering course that is not granted from the BE.                                                                                                                                                                                                                                                                                                                                                                                                                |                                                        |              |
| <b>GIN612</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>Software Verification and Validation</b>            | <b>3 cr.</b> |
| This course covers the following topics: validation of a software product by testing its complete integration; preconditions, post-conditions and invariants; use of models in software development; test and verification of software; audit programs by symbolic execution; predicate logic of first-order; Hoare logic; and development of correct programs built from templates.                                                                                                                                                                                                                                                                                                                                                                                          |                                                        |              |
| <b>GIN622</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>Computer Network Security</b>                       | <b>3 cr.</b> |
| <b>Pre-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | GIN550                                                 |              |
| The purpose of this course is to introduce the principles of security in fixed and mobile networks. The course starts with an introduction to information security concepts, security services and security mechanisms. In the second part, we discuss the concepts of symmetric and asymmetric cryptography, the hash function and the signature and key sharing procedures and we apply these concepts to secure the data communication using the SSL and the IPSec protocols. In the third part, we discuss security in wireless networks, intrusions and filtering mechanisms through the use of firewalls. Finally, we discuss security management and risk management concepts.                                                                                         |                                                        |              |
| <b>GIN623</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>Planning and Configuration of Computer Networks</b> | <b>3 cr.</b> |
| <b>Pre-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | GIN622                                                 |              |
| Students will study: computer network planning process; requirements and specifications; modeling of the main network planning problems; topological design and expansion; location of equipment; computer networks at several levels; design of computer networks and routing traffic with performance, reliability and quality of service QOS; resource allocation in computer networks; case studies; protocols and operation of switches and routers; network design including the choice of technologies, protocols and equipment; configuration of switches and routers (wired and wireless); structured cabling; network operating systems; telephony and VoIP; network management (performance management, configuration and faults in networks); and virtualization. |                                                        |              |
| <b>GIN624</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>Distributed Systems</b>                             | <b>3</b>     |

| The objective of this course is to explain the principles of distributed systems and their different hardware and software architectures. The concepts discussed are: C/S and P2P architectures, inter-process communication, distributed file systems, sockets programming, calling procedures and methods remotely (RPC and RMI, CORBA architecture), time synchronization in distributed systems, logical time, coordination algorithms, mutual exclusion, cloud computing, grid computing, clusters, and an introduction to parallel programming.                                                                                                                                                                                                                         |                                                        |              |
| <b>GIN625</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>Mobile Devices Programming</b>                      | <b>2 cr.</b> |
| Students will learn about programming mobile devices with an emphasis on the environment and the Android platform. This course focuses on research and projects. The main themes of the course revolve around the design of applications for mobile devices with unique challenges (user interface, mobile-specific technologies), and the importance of performance. The Android SDK has its own interesting aspects to learn. The multi-touch model, accelerometer, and other important API receive significant attention. Students will learn the concepts of development applicable to any type of mobile environment: iOS, BlackBerry, Symbian, Windows Phone.                                                                                                           |                                                        |              |
| <b>GIN632</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>Artificial Intelligence</b>                         | <b>3 cr.</b> |
| This course covers the techniques used to design intelligent computer systems using the recent artificial intelligence (AI) techniques. Topics include intelligent agents, problem solving by searching, informed search and exploration, constraint satisfaction problems, knowledge representation and reasoning, planning, uncertain knowledge and reasoning and Machine Learning. The course also discusses advanced AI applications such as natural language processing, computer games, and robotics.                                                                                                                                                                                                                                                                   |                                                        |              |

| Mechanical Eng. Graphics course is the professional language in the mechanical engineering world. The purpose of this course is to teach the students the standards of drawing, how to draw the projection views, perspective views, and section views using a 2D and 3D model. The students will be able to read and to draw an assembly place and to place the dimensions as well as the tolerances on their drawings. The drawings will be performed on papers and on a computer aided design program (2D,3D).                                                                                                                                                                                                                                                             |                                                        |              |
| <b>GMC310</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>Statics</b>                                         | <b>3 cr.</b> |

The course covers fundamental concepts of mechanics relating to forces acting on rigid bodies. It includes problems involving actions and reactions on structures and machines in two and three dimensions, shear and moment diagrams, centroids, center of mass/gravity, moments of inertia, friction, dry friction and friction forces on screws.

**GMC320 Dynamics 3 cr.**

**Co-requisites** MAT227 Y

This course presents the fundamentals of engineering dynamics. It covers the following topics: kinematics of a particle (absolute and relative motion, description of motion in various systems of coordinates); kinetics of a particle; force and acceleration (Newton's second law of motion); work and energy (principle of conservation of energy); impulse and momentum (conservation of linear momentum).

**GMC330 Dynamics of Rigid Bodies 3 cr.**

**Pre-requisites** MAT307 And GMC310 And GMC320

Kinematics of rigid bodies in plane and space motion. Moving reference frames. Dynamics of rigid bodies in plane motion. Energy and momentum methods. Dynamics of rigid bodies in space motion. Tensor of inertia. Euler's equation of motion. Gyroscope. Finally, an introduction to the Vibrational Motion, or what happens when objects oscillate about a neutral state will be covered.

**GMC340 Thermodynamics 3 cr.**

**Pre-requisites** CHM212 Or CHE212

This course is designed to provide a fundamental understanding of the transformation of thermal energy and the behavior of its physical quantities. Such transformation is the conversion of heat into work. Engineers are generally interested in studying systems and how they interact with their surroundings. Its use becomes indispensable in our society.

**GMC420 Applied Thermodynamics 3 cr.**

**Pre-requisites** GMC340

This course is the second part of Thermodynamics. It prepares the students to analyze and design preliminary thermodynamic plants by applying and examining the following concepts: the generation of electric power using steam and gas power plants; refrigeration and air conditioning and heat pumps; cogeneration facilities; gas turbines and their use in the aerospace industry; gas mixtures and psychrometrics; reacting mixtures and combustion.

**GMC425 Instrumentation and Measurements for Mechanical Engineers 3 cr.**

**Pre-requisites** GMC471 And GMC472 And (GEL410 Or GEL320)

This course presents the application of measurement theory with statistics and uncertainty analysis. The course provides a broad treatment of analog and digital sampling methods and focus on instrumentation. A course on the general concepts of measurement systems; classification of sensors and sensors types; interfacing concepts; data acquisition, manipulation, transmission, and recording; introduction to LABVIEW; applications; and a team project on design, and implementation of a measuring device.

**GMC430 Fluid Mechanics 3 cr.**

**Pre-requisites** GMC320 And GMC340

**Co-requisites** MAT337 Y

This course provides a concise and clear presentation of fundamental topics in fluid mechanics, which deals with energy transportation by a fluid. These topics concern the development and application of control volume and differential form analysis and applications of fluid flows. Topics include fundamental concepts, basic equations in integral form for a control volume, introduction to differential analysis of fluid motion, potential flow, incompressible flow, and internal and external viscous flows including boundary layer concepts.

**GMC435 Hydraulics 2 cr.**

**Pre-requisites** GMC430

This course deals with basic concepts of hydraulics, namely, the continuity, energy and momentum equations. This includes Laminar and turbulent flow in pipes, internal viscous with application of Bernoulli equation, losses and pipe networks. It develops also hydraulic pumps, and turbines. Further, this course covers open channel flows and describes the hydraulic structures.

**GMC440 Strength of Materials 3 cr.**

**Pre-requisites** MAT227 And GMC310

**Co-requisites** GMC472

This course presents the theory and application of the fundamentals of mechanics of materials: stress and strain; tension, compression, and shear; Hooke's law, Mohr's circle, combined stresses, strain-energy; beams, columns, shafts, and continuous beams; deflections, shear and moment diagrams; thin-walled structures, buckling and columns.

**GMC441 Mechanics of Continuous Medium 3 cr.**

**Pre-requisites** GMC330

Fundamental principles of the mechanics of deformable bodies. Topics include Cartesian tensors. The linear elastic boundary value problem.

Boundary conditions. Naviers equations. Plane waves.

General conservation laws for mass, momentum and angular momentum. Deformation of a continuum: Euler and Lagrange descriptions, displacement vector, strain tensor, principal strains, compatibility equations.

The state of stress in a continuum: stress vector, stress tensor, principal stress, and equations of motion.

Constitutive equations: isotropic and anisotropic linear elastic materials

Newtonian fluids: compressible and incompressible fluids, Navier-Stokes equations.

**GMC444 Stress Analysis and Design 3 cr.**

**Pre-requisites** GMC445

The objective of this course is to introduce machinery design for the students. They will learn the broadest aspects of engineering design, and will have a solid knowledge of how to present a methodology for solving a machine component problem, taking into account the safety factor, ecology and social significance. Also, this course covers the structural integrity of any mechanical machinery components, theories of failure, reliability analysis, selection of materials, stability, impact, fatigue and fracture mechanics and surface damage assessment.

**GMC445 Metallurgy 3 cr.**

**Pre-requisites** (CHM212 Or CHE212) And GMC440 and (GMC360 or GMC260)

The objective of this course is to give students basic knowledge about the available materials (ferrous and non-ferrous), the principles of material selection, and how to find suitable materials for their design projects based on the mechanical properties, and the choice of appropriate heat

treatment procedure. Also covered will be the knowledge of welding procedures, focusing on the most common welding procedures for construction and maintenance.

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                 |              |

| <p>Mechanical engineers come across many machines. Therefore, the knowledge of various mechanisms, power transmission, linkages and dynamical forces are offered in this subject. The study of kinematics is concerned with understanding relationships between the geometry and the motions of the parts of a machine. The overall objective of this course is to learn how to analyze the motions of mechanisms, and design mechanisms to give desired motions. This course includes relative motion analysis, design of gears, gear trains, cams and linkages, graphical and analytical analysis of position, velocity and acceleration. Students will be able to understand the concepts of displacement, velocity and acceleration of a simple mechanism, drawing the profile of cams and its analysis, gear kinematics with gear train calculations, theory of friction.</p> |                                                 |              |

| <p>The objective of this course is to extend the knowledge of thermodynamics and fluid analysis by considering the rates of the heat transfer modes, namely, conduction, convection, and radiation and their applications. Thus, the course will cover steady and transient heat conduction, extended surfaces, external and internal forced convection of laminar and turbulent flows, natural convection, heat exchanger principles, thermal radiation, view factors and radiation exchange between diffuse and gray surfaces. Further, numerical simulations in one and two-dimensional problems will be developed.</p>                                                                                                                                                                                                                                                         |                                                 |              |

| <p>The design of an engine is highly empirical science. We are used to concentrate our researches on internal combustion engine which is not a trend anymore. Therefore, this course is intended to represent all kind of engines and demonstrate the application of engineering sciences applied to each one: internal combustion engine, electrical vehicles, hybrid vehicles and other. For each type of engine, the air-pollution, the fuel cost, the performance and other parameters will be study as described below in the course outline.</p>                                                                                                                                                                                                                                                                                                                             |                                                 |              |

| <p>This course introduces the organizational and functional requirements for effective production. Tolerance charts and work piece control are used to plan the manufacturing sequence, select the preferred manufacturing equipment and the operational sequence. The course deals with production tooling requirements and tooling cost estimates. Design of tooling for turret lathes, automatic screw machines, multiple spindle lathes, and production milling machines is treated.</p>                                                                                                                                                                                                                                                                                                                                                                                       |                                                 |              |

| <p>This course is intended to introduce the sanitary, plumbing and heating systems applied in the construction field. For the heating aspect, it prepares the students to become familiar with the preliminary rules and standards for analyzing, calculating and designing a complete hot water heating system with all its components, ranging from the mechanical room equipment to the distribution piping networks and ending with the heat emitters. For the sanitary and plumbing systems it aims to provide the know-how to design and calculate the cold, hot, hot water return, waste, sewage and storm systems with all necessary equipment as pumps, cold storage tanks, hot water heaters, valves, pipe sizing and layouts.</p>                                                                                                                                       |                                                 |              |

| <b>Pre-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | GMC430                                          |              |
| <p>This course has four parts. The first is devoted to the study of internal viscous flow with application of Bernoulli equation and losses. Further, it covers external viscous flows including boundary layers concepts. The third part concerns the compressibility effects in gas flows: the speed of sound, adiabatic and isentropic steady flow, isentropic flow with area changes, normal-shock wave, and operation of converging and diverging nozzles, two-dimensional supersonic flow, and Prandtl-Meyer expansion waves. The last part concerns the fluid machinery: Basic equations and applications.</p>                                                                                                                                                                                                                                                              |                                                 |              |

| <p>The design of the internal combustion engine is highly empirical science. This course is intended to demonstrate the application of engineering sciences applied to internal combustion engines, both spark-ignition and compression-ignition. Such applications include stoichiometry and thermochemistry of air-fuel mixtures, predictions of chemical equilibrium, heat transfer, fluid flow, and friction, lubrication processes relevant to ICE design, performance, efficiency, emissions, fuel requirements, air-pollution, fuel cost, and others.</p>                                                                                                                                                                                                                                                                                                                   |                                                 |              |

| <p>The objective of this course is to introduce the mechatronic systems design and its implementation to robots control, stability, and autonomous capabilities. Hardware and Software components of the robot are included, the sensors (RGB, 3D and inertial) for providing perception capabilities to the hexapods which are used in the projects. The perception will allow the platform to localize itself (estimate its position), maintain a map of the context of operation, and perform path planning based on that map.</p>                                                                                                                                                                                                                                                                                                                                              |                                                 |              |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                            |              |

| Students will apply the techniques of traditional machining (lathing, sharpening, drilling, milling and rectifying), looking at the choice of the appropriate materials for cutting tools, the sharpening of the lathing cutting tools and how to prepare the technical sheet of machining. They will also apply some techniques and positions for MMA welding.                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                            |              |

| The objective of this laboratory is to show the students different experiments in thermal sciences. The students will investigate the laws and theories of thermodynamics, fluid mechanics, and heat transfer using diverse methods of measurements including limitations and boundaries of each theory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                            |              |

| This course starts with a brief introduction about the safety procedures of the lab. Reliability of measurements and statistical analysis for experimental data is provided to the students. They will also study: verification of theoretical models through testing; trusses, tension test (stress-strain diagram, determination of yield strength, ultimate strength, modulus of elasticity, percentage elongation and percentage reduction in areas); buckling test; hardness tests; impact tests; parabolic arc; and suspension bridges.                                                                                                                                                                                                                                                 |                                                            |              |

| This course is to emphasize the use programming and software tools of a dynamical system; design models to understand its performance; evaluate various strategies for its operation. Apply proper working methods of modeling mechanical systems, so that can be applied to solve problems in the field of mechanical engineering but also in general engineering covering techniques of analysis of linear control system, such as root locus method, stability considerations, and phase-gain-frequency diagrams, and design using compensating networks and optimization. Students are also expected to have knowledge of State Variables in Automatic Control covering applications of vector-matrix equations related to control systems, stability, controllability and observability. |                                                            |              |
| <b>GMC477</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>Hydraulics Lab</b>                                      | <b>1 cr.</b> |

| The objective of this laboratory is to show the students different experiments in fluids and hydraulics sciences. The students will investigate the laws and theories of thermodynamics, fluid mechanics, and hydraulics using diverse methods of measurements including limitations and boundaries of each theory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                            |              |

| This training enables the students to face new challenging engineering practice in the real world. Further, this training permits the students to discover how to meet desired needs within realistic constraints such as economic, environmental, social, ethical, manufacturability, and sustainability. The students will communicate effectively and have an understanding of professional and ethical responsibility, and the impact of engineering solutions. The students will, at the end of their training session, submit a report for evaluation.                                                                                                                                                                                                                                  |                                                            |              |

| The objective of this course is to learn design techniques used in the practice of mechanical engineering. Design methodologies are taught during lectures, and a design project is completed during the delivery of the course. Integrative design in mechanical engineering; multidisciplinary design project considering both technical and non-technical contexts; organizational dynamics and communications.                                                                                                                                                                                                                                                                                                                                                                            |                                                            |              |

| This course is aimed at introducing the students to the basic principles of modern turbomachinery. Emphasis will be placed on steam and gas turbine applications and design. Therefore, applications of the principle of the fluid mechanics, thermodynamics and aerodynamics to design and analysis of turbines, pumps and compressors will be covered.                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                            |              |

| The objective of this course is to introduce the mechatronic systems design and its implementation to robots control, stability, and autonomous capabilities. Hardware and Software components of the robot are included, the sensors (RGB, 3D and inertial) for providing perception capabilities to the hexapods which are used in the projects. The perception will allow the platform to localize itself (estimate its position), maintain a map of the context of operation, and perform path planning based on that map.                                                                                                                                                                                                                                                                |                                                            |              |

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |              |

|                       | This course presents basic concepts and operation of fluid power, demonstrating knowledge in maintenance, safety, and troubleshooting. Students will perform fluid power operation in the use of hydraulic power systems, symbols and schematic interpretation, industrial hydraulics, pressure control valves, directional control valves, check valves, flow control valves, actuators, pumps, oil conditioners and measuring instruments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |              |

|                       | This course studies different manufacturing techniques by machining on the milling machines and grinders, in order to realize the mechanical parts in adequacy with their design. The course introduces the students to the industrial and manufacturing process, and prepares them to a wide range of machining and tools for advanced manufacturing technology.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |              |

|                       | This is in-depth course for students who are seeking to have a professional career in Steel Structures Design: ASD/LRFD. The aim of this course is to introduce the theoretical background and fundamental basis of steel design and covers the detailed design of members and their connections. Students will examine the design of steel components, local buckling, and cross-section classification, design of tension members, compression members, beams and beam-columns. Also covered will be the design of steel connections, general consideration of bolts and welds, analysis and design of connections. At the end of this course students will have sufficient knowledge about the behavior of steel structures and how to design structural steel members and connections using the Specification for Structural Steel Buildings code AISC, Minimum Design Loads for Buildings and Other Structures code ASCE and the International Building Code ICC. STAAD Pro is adopted for this course. |              |

|                       | This course covers the fundamentals and the applications of the acoustics. It describes the physics of sound and the effects that can have on people. It provides a review and derivation of the equations of acoustics, and introduces benchmark analytical solutions with some illustrations. It presents different systems that control sound and the requirements, principles and methods of noise and vibration control. It explores the physical mechanisms that govern the functioning of a wide range of musical instruments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |              |

|                       | The objectives of this course is to introduce the students to structural mechanics and applications of composites materials. Anisotropic materials; laminated composites; buckling and dynamics; strength and failure; inter-laminar stresses; de-lamination; design considerations. Students will acquire knowledge on advanced composite material such as: Macro-mechanics of a lamina, Micro-mechanical analysis of a lamina, Analysis of laminates, Failure analysis of laminates and Design of laminated composite structures.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |              |
| <b>GMC519</b>         | <b>Mechatronic Systems Lab</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>1 cr.</b> |

|                       | Mechatronics is a design philosophy involving a complete integration of mechanical engineering, electronics, control theory and computer engineering in order to design a product. It is based on an interdisciplinary approach involving many disciplines concurrently and allowing flexibility and adaptability by replacing some mechanical functions by electronic processing. The lab is a concrete proof of the importance of the interdisciplinary approach by applying instrumentation concepts and mechanical control using a PLC with its human to machine interface.                                                                                                                                                                                                                                                                                                                                                                                                                              |              |
| <b>GMC520</b>         | <b>Advanced Transport Phenomena</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>3 cr.</b> |
|                       | The course aims to provide an in depth knowledge of heat, mass and momentum transport that is necessary in assessing, analyzing and developing typical chemical engineering and environmental technologies. The course focuses on modeling momentum, heat & mass transfer processes using analytical and numerical solutions of the partial differential equations of transport phenomena.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |              |

|                       | An introductory course that demonstrates the integration of Computer-Aided-Design (CAD) and Computer-Aided-Manufacturing (CAM). This is a study of modern prototyping and machining methods, teaching the use of specific software for converting 2D and 3D CAD drawing geometry directly into toolpath information used to drive numerically controlled turning and milling machines.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |              |

|                       | CAD/CAM Lab is designed to help the student acquire knowledge and skill in the use of numerical control (NC) and computer numerical control (CNC) using our CNC Router. The course will also include NC and CNC general concepts and programming procedures using G and M codes. Students will have hands-on experience in manually programming, and setting up a CNC Router. Students will become familiar with Windows, CATIA, and Mastercam to aid in programming our CNC Router. People who can build, repair, operate, program CNC equipment are in high demand. The ability to apply math, science, and design concepts to complex problems is becoming increasingly important. The class is designed to prepare students for the world of work, advancement to the local community college, or a four-year university under the umbrella of engineering and manufacturing.                                                                                                                            |              |
| <b>GMC536</b>         | <b>Air Conditioning</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>2 cr.</b> |
| <b>Pre-requisites</b> | GMC451                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |              |

This course is intended to introduce the air conditioning systems applied in the construction field. The first part covers the calculation procedure and methodology for determining the air conditioning load necessary for the studied application; the second part introduces and discusses the humid air evolution on the psychrometric chart to finally select the required and suitable air conditioning unit.

**GMC539 Computational Fluid Dynamics 3 cr.**

**Pre-requisites** GMC465 or GMC464

**Co-requisites** GMC508

The goal of the course is to teach the fundamental techniques most commonly used to numerically solve partial differential equations (PDEs), with particular focus on the equations governing fluid flows. Beginning with consideration of heat conduction, the course discusses the interaction of convection and conduction leading to analysis of the procedure for fluid flow calculation. Finite difference, finite volume, and finite element methods are studied as different means of discretizing a range of equations central to applications in science and engineering.

**GMC541 Machinery Design 3 cr.**

**Pre-requisites** GMC460 Or GMC444

The objective of this course is to introduce machinery design for the students. They will learn to define and understand the problem, identify the knows, identify the unknowns and formulate the solution, state all assumptions and decisions, analyze the problem evaluate the solution and present it. Also, this course covers the design and calculation of mechanical elements, selection of the right materials for these elements, and to present the solution of a power transmission case study as a mini project.

**GMC543 Energy Production 3 cr.**

This course covers: the generation of electric power using fossil and wind energy sources; power plant thermal cycle analysis; cogeneration and combined cycles; wind energy and capacity; economics, operations, and design of electric power stations.

**GMC544 Fluid Rheology 3 cr.**

The aim of this course is to provide the students an understanding of rheology and its applications. This course will cover the complex fluids rheology, basic concepts, its relationship to processing, as well as the viscoelastic material properties. Examples will focus on several types of complex fluids including polymer melts.

**GMC545 Advanced Manufacturing Techniques 2 cr.**

**Pre-requisites** GMC612

The objective of this course is to expand on the preliminary industrial development and expose the student to design, planning, scheduling, and control of manufacturing systems with emphasis on information flow and decision-making within the field of manufacturing. Additionally, the course is designed to introduce students to a number of interpersonal skills and competencies necessary for a sustained career in manufacturing such as system simulation, simulation models of manufacturing systems and system performance under different production planning and control policies.

**GMC546 Continuum Mechanics 3 cr.**

Fundamental principles of the mechanics of deformable bodies. Topics include Cartesian tensors. The linear elastic boundary value problem. Boundary conditions. Naviers equations. Plane waves.

General conservation laws for mass, momentum and angular momentum. Deformation of a continuum: Euler and Lagrange descriptions, displacement vector, strain tensor, principal strains, compatibility equations.

The state of stress in a continuum: stress vector, stress tensor, principal stress, and equations of motion.

Constitutive equations: isotropic and anisotropic linear elastic materials

Newtonian fluids: compressible and incompressible fluids, Navier-Stokes equations.

**GMC550 Turbomachinery 3 cr.**

This course is aimed to introduce students to the basic principles of modern turbomachinery. Emphasis will be placed on steam and gas turbine applications and design. Therefore, applications of the principles of fluid mechanics, thermodynamics and aerodynamics to design and analysis of turbines, pumps and compressors will be covered.

**GMC555 Thermal System Design 3 cr.**

**Pre-requisites** GMC451 and GEN428

**GMC563 Fluid Rheology 3 cr.**

**Pre-requisites** GMC430

The aim of this course is to provide the students an understanding of rheology and its applications. This course will cover the complex fluids rheology, basic concepts, its relationship to processing, as well as the viscoelastic material properties. Examples will focus on several types of complex fluids including polymer melts.

**GMC575 3D Modeling and Graphics Lab 1 cr.**

**Pre-requisites** GMC360 or GMC260

This course is an advanced course to engineering design and the related graphical tools used to communicate design concepts. Topics include the following: visual thinking, engineering design, pictorial sketching, solid modeling, engineering drawing standards, tolerancing, plotting, and computer-aided design. The students will learn the part design, using the features provided by CATIA, using the workbenches sketcher, part design, assembly design, wireframe and surface design wireframe.

**GMC576 Stability and Control Lab 1 cr.**

**Pre-requisites** GMC330 and GEL425

This course teaches the students the principles of robot dynamics through different computer simulation and experimental applications, and highlights the problems of controlling a robot motion. Static and dynamic stability and response characteristics are defined. Motion qualities of a robot, and disturbances affecting its motion, are to be tested and analyzed in the lab with stability and related sensor systems.

**GMC581 Internship II 1 cr.**

**Pre-requisites** GMC596

This is a training course done in industry. It enables the students to discover the working world to meet desired needs within realistic constraints such as economic, environmental, social, ethical, manufacturability, and sustainability. The students will communicate effectively and have understanding of professional and ethical responsibility, and the impact of engineering solutions. The students will, at the end of their training session, submit a report to be evaluated by a departmental committee.

**GMC596 Final Project I 1 cr.**

The Final Year Project (FYP) within the Department of Mechanical Engineering at USEK consists of two parts for completing a capstone design project, GMC 596 (FYP I) and GMC 597 (FYP II). This course encourages the student to demonstrate his/her awareness to start his career as a professional engineer. This is done by investigating a research topic relevant to the profession and, further, by assessing its practical experience. The research topic will give the student the opportunity to apply his knowledge and skills from various courses and laboratories throughout his investigation of an approved research topic.

The first goal of GMC 596 is to teach the interrelation of design and research in Mechanical Engineering. Students will learn how to address a problem of solid mechanics and/or thermos-fluid significance using Mechanical Engineering tools and by referring to the international standards and codes such as ASME, ASTM, ASHRAE, AIRAH, etc... . Students will be trained in skills needed to succeed in a research laboratory, and to accomplish their projects efficiently. They will also learn the importance of understanding the context of their work with respect to their colleagues, their peers, their society, and their world.

The second goal of GMC 596 is to ensure that all students are associated with a research laboratory and launched on their capstone engineering design project (FYP II, GMC 597), and to confirm that each GMC 597 project will be a culminating Mechanical Engineering design experience. Every student is required to submit a detailed plan for their design project or research project, as appropriate. The nature of the project is examined by the supervisor. GMC 596 may include a practice design project, in which teams of 2-3 students develop a Research and Development (R&D) plan for a marketable product. Students will be graded on their ability to process and communicate ideas of their proposed research project, and on their practice design project if one is required. More details could be found on the FYP regulation and guidelines.

|----------------------|--------|--|

This course deals with topics in renewable energy system technology from a mechanical engineering point of view. The full spectrum of alternative and renewable energy is introduced and analyzed, including methods of integrating these solutions in society in order to fulfill requirements for energy services in a sustainable way. The principles, possibilities, and limits of alternative and renewable energy are covered.

This course is designed to give the students hands-on experience with carrying out energy audit measurements. Application will be based on residential and commercial buildings. Topics included are: energy audit instrumentation and measurement devices; indoor air quality; and the saving potential associated with several energy conservation measures as applied to buildings.

|               |                                            |              |

| <b>GMC609</b> | <b>Micro and Nanoscale Fluid Mechanics</b> | <b>3 cr.</b> |
|---------------|--------------------------------------------|--------------|

Students will study the fundamentals of micro-scale flows and microfabrication. The course also includes design of microfluidic components and a few applications of microfluidic systems. The fundamentals of fluid flows at micro-scale including intermolecular forces, low Re flows, slip theory, capillary flows and electrokinetics are discussed. The principles of microfabrication with silicon and polymer substrates are illustrated. Theory and design of various microfluidic components including micro pumps, micromixers, micro valves are also covered.

|----------------------|--------|--|

This course studies different manufacturing techniques by machining on the milling machines and grinders, in order to realize the mechanical parts in adequacy with their design. The course introduces the students to the industrial and manufacturing process, and prepares them to a wide range of machining and tools for advanced manufacturing technology.

|               |                                                          |              |
|---------------|----------------------------------------------------------|--------------|
| <b>GMC616</b> | <b>Design for Pressure Vessels, Piping and Pipelines</b> | <b>3 cr.</b> |
|---------------|----------------------------------------------------------|--------------|

In this course, students will study: methods for determining stresses; terminology and ligament efficiency; stresses in a circular ring, cylinder; dilation of pressure vessels; membrane stress; analysis of vessels; cylindrical, spherical and, conical heads; thermal stresses; discontinuity stresses in pressure vessels; design of tall cylindrical self-supporting process columns; supports for short vertical vessels; stress concentration at a variable thickness transition section in a cylindrical vessel, about a circular hole, elliptical openings; Theory of Reinforcement; pressure vessel design; piping loads; primary, secondary, sustained loads, occasional loads, static and dynamic loads; piping stresses (primary, secondary); stresses acting in a pipe due to internal pressure; stresses acting in a pipe due to pipe weight.

|               |                                   |              |
|---------------|-----------------------------------|--------------|
| <b>GMC617</b> | <b>Statistical Thermodynamics</b> | <b>3 cr.</b> |
|---------------|-----------------------------------|--------------|

This course covers the following topics: Boltzmann statistics; ensembles; classical statistical thermodynamics; partition functions; virial expansions; Debye-Hückel theory for electrolytes; grid-based models for liquids; the Bragg-William approximation; molecular dynamics; Monte Carlo simulations; Brownian dynamics; Lagrangian and Hamiltonian functions; Extended Lagrangian methods; simulations in different ensembles; force fields for molecules, liquids and solids; many-body and polarization models; superposition and free energy; and simulations in the bulk of surfaces, polymers and colloids.

|---------------|------------------------|--------------|
| <b>GMC622</b> | <b>Steel Structure</b> | <b>3 cr.</b> |
|---------------|------------------------|--------------|

This is in-depth course for students who are seeking to have a professional career in Steel Structures Design: ASD/LRFD. The aim of this course is to introduce the theoretical background and fundamental basis of steel design and covers the detailed design of members and their connections. Students will examine the design of steel components, local buckling, and cross-section classification, design of tension members, compression members, beams and beam-columns. Also covered will be the design of steel connections, general consideration of bolts and welds, analysis and design of connections. At the end of this course students will have sufficient knowledge about the behavior of steel structures and how to design structural steel members and connections using the Specification for Structural Steel Buildings code AISC, Minimum Design Loads for Buildings and Other Structures code ASCE and the International Building Code ICC. STAAD Pro is adopted for this course.

|----------------------|--------|--|
| <b>Co-requisites</b> | GMC626 |  |
|----------------------|--------|--|

An introductory course that demonstrates the integration of Computer-Aided-Design (CAD) and Computer-Aided-Manufacturing (CAM). This is a study of modern prototyping and machining methods, teaching the use of specific software for converting 2D and 3D CAD drawing geometry directly into toolpath information used to drive numerically controlled turning and milling machines.

| CAD/CAM Lab is designed to help the student acquire knowledge and skill in the use of numerical control (NC) and computer numerical control (CNC) using our CNC Router. The course will also include NC and CNC general concepts and programming procedures using G and M codes. Students will have hands-on experience in manually programming, and setting up a CNC Router. Students will become familiar with Windows, CATIA, and Mastercam to aid in programming our CNC Router. People who can build, repair, operate, program CNC equipment are in high demand. The ability to apply math, science, and design concepts to complex problems is becoming increasingly important. The class is designed to prepare students for the world of work, advancement to the local community college, or a four-year university under the umbrella of engineering and manufacturing. |                                                              |              |

| This course provides a review of thermodynamics principles. It then looks at: the fundamentals of heat and mass transfer; theoretical and actual vapor compression cycles; food storage conditions; main components (compressor, condenser, evaporator, expansion valves); refrigerants; and cooling load calculation for refrigeration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                              |              |

| The goal of the course is to teach the fundamental techniques most commonly used to numerically solve partial differential equations (PDEs), with particular focus on the equations governing fluid flows. Beginning with consideration of heat conduction, the course discusses the interaction of convection and conduction leading to analysis of the procedure for fluid flow calculation. Finite difference, finite volume, and finite element methods are studied as different means of discretizing a range of equations central to applications in science and engineering                                                                                                                                                                                                                                                                                                |                                                              |              |

| This course examines the systems and the basic components that make up these systems, both hydraulic and pneumatic. Emphasis is placed on understanding the language and graphical symbols associated with fluid power and the performance characteristics of system components.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                              |              |
| <b>GMC653</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>Mechanics of Fracture and Fatigue</b>                     | <b>3 cr.</b> |
| Students will learn about the principles of fracture mechanics, methods and practice used to safeguard structures against fracture and fatigue failures, and damage tolerance analysis of structures that are pertinent in the design of advanced structures such as aerospace and automobile structural components.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                              |              |
| <b>GMC655</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>Thermal Mechanical Design</b>                             | <b>3 cr.</b> |
| In this course, creative decisions and design in thermodynamics and heat transfer integrated concepts, laws, and methodologies from thermal sciences are used to analyze, model, and design energy systems and to predict system performance for fixed designs. Students will study: the analysis, modeling, and design of representative subsystems; analysis and modeling of thermal and fluid systems; evaluation of system performance; consideration of system economics; capital and operating cost estimation; and system design optimization.                                                                                                                                                                                                                                                                                                                             |                                                              |              |

| This course covers the areas of technology on which successful mechatronic system designs are based: physical modeling, from design model to truth model, and mathematical modeling of dynamic multidisciplinary physical systems; analysis of mathematical models through analysis and computer simulation; Magnetic Levitation System, Balancing Robot/Segway Human Transporter; Inverted Pendulum Systems (Translational, Rotary, Planetary Gear); Coulomb friction, gear backlash, unmodeled resonances; Hydraulically Balanced Beam System; and mechatronic industrial case studies.                                                                                                                                                                                                                                                                                         |                                                              |              |
| <b>GMC661</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>Orbital Mechanics</b>                                     | <b>3 cr.</b> |
| Students will study the two-body problem, earth-satellite operations, reentry dynamics, space environments, interplanetary trajectories, numerical simulations, and work on a design project.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                              |              |
| <b>GMC662</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>Biomechanics of Human Movement</b>                        | <b>3 cr.</b> |
| This course covers the following topics: skeletal anatomy and mechanics; muscle anatomy and mechanics; theory and application of electromyography; motion and force measuring equipment and techniques; and inverse dynamics modeling of the human body.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                              |              |
| <b>GMC663</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>Advanced Strength of Materials and Applied Elasticity</b> | <b>3 cr.</b> |
| The course covers the following topics: analysis of stress, strain and material properties, problems in elasticity, failure criteria, bending of beams, torsion of prismatic bars, numerical methods, application of energy methods, and plastic behavior of materials.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                              |              |
| <b>GMC665</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>Smart Materials</b>                                       | <b>3 cr.</b> |
| Students will learn about the structure and physical properties of smart materials used in electrical engineering. Properties of materials and structures will be discussed in the broader external conditions of use with the presentation of selected technologies. The following topics will also be explored: areas of application of intelligent systems; nanostructures, gels, coatings, LB films, electrochromic sol-gel coatings, PH indicators, indicating chemical materials, hybrid and composite systems; metallic and nonmetallic materials with shape memory principles and applications; active and passive vibration damping, such as sensors for airbags, acoustic transducers, precision pointing devices, miniature ultrasonic motors, injectors; degradation mechanisms in different types of materials and durability tests.                                 |                                                              |              |
| <b>GMC670</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>Advanced Energy Systems Lab</b>                           | <b>1 cr.</b> |
| This lab covers the advanced topics in air conditioning, refrigeration and heating technology. It prepares graduate engineers to install and maintain climate control systems, to work with mechanical, electrical and electronic components that deal with heating and cooling equipment. After completing this lab, students will be able to find work with contractors, utility companies, office buildings, plants and more.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                              |              |

The objective of this course is to introduce the mechatronic systems design and its implementation to robots control, stability, and autonomous capabilities. Hardware and Software components of the robot are included, the sensors (RGB, 3D and inertial) for providing perception capabilities to the hexapods which are used in the projects. The perception will allow the platform to localize itself (estimate its position), maintain a map of the context of operation, and perform path planning based on that map.

| <p>Mechatronics is a design philosophy involving a complete integration of mechanical engineering, electronics, control theory and computer engineering in order to design a product. It is based on an interdisciplinary approach involving many disciplines concurrently and allowing flexibility and adaptability by replacing some mechanical functions by electronic processing. The lab is a concrete proof of the importance of the interdisciplinary approach by applying instrumentation concepts and mechanical control using a PLC with its human to machine interface.</p>                        |                                               |              |

| <p>The purpose of this course is to give a strong and clear basis regarding technical characteristics of networks and their functioning. Reference models of the network architectures OSI and TCP/IP will be described. Then, we will detail the different levels of this architecture. In brief, we will look at transmission basics, protocols for link control and media access control, network equipment, Ethernet and IP networks, routing, transport protocols and application protocols for the Internet.</p>                                                                                        |                                               |              |

| <p>This course starts by an overview of stochastic processes. Analog (amplitude and angle) modulation/demodulation techniques (AM-DSBSC, AM-DSBTC, SSB, VSB, FM, PM) are then introduced, and the effect of noise on analog modulations is then studied. Signal digitization (PCM) and line coding are then considered. Digital modulations (ASK, PSK, FSK, M-ary modulations, etc.), matched filtering, and system performance evaluation in the presence of noise are then studied.</p>                                                                                                                     |                                               |              |

| <p>The purpose of this lab is to apply the information given in the course using different approaches: configuration of network equipment and network installation, network supervising and troubleshooting using different tools, then performance evaluation. For that, we will mainly use network specialized simulators like CISCO Packet Tracer and the Wireshark software used for packets capture and protocol analysis. In brief, we will look at some protocols from application layer (HTTP, DNS), TCP protocol, ARP protocol, Ethernet network, static and dynamic routing protocols and VLAN.</p> |                                               |              |

After spending one to two months in a company, living the real-world professional experience outside the academic environment of the university, the students enroll in this course and submit a report containing all they have learnt, the difficulties faced, and the correlation with the courses studied.

| This course starts with an overview of stochastic processes. Signal digitization (PCM) and line coding are then considered. Digital modulations (ASK, PSK, FSK, M-ary modulations, etc.), matched filtering, and system performance evaluation are then studied. Advanced topics (e.g. spread spectrum) are then introduced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                              |              |

| <b>Pre-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | GRT432                                       |              |
| In this course, optical communication systems are first introduced. Optical fibers are studied next (step-index, graded-index, multimode, single-mode) as well as signal propagation and degradation. Optical sources (LASER, LED) and receivers (PIN, APD) are then discussed, with the probabilistic theory behind receiver operation. Finally, the design of a complete optical communication system is considered, taking into account attenuation, error probability, SNR, power constraints, etc.                                                                                                                                                                                                                                                                                                                                                                 |                                              |              |

| This course examines network modeling of information transfer, telephone networks, land mobile systems and satellites. There is also simulation of different layers of systems and exchange protocols.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                              |              |

| The aim of this course is to introduce telecom engineer students to the evolution of telecom markets, the drivers of telecom regulations, and the impact on the telecom sector at a national level. The course will provide the students with an opportunity to understand the market drivers for the telecom sector, the key stakeholders, the investors' prospective, and be able to benchmark and compare different models.                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                              |              |

| The purpose of this course is to introduce the principles of security in fixed and mobile networks. The course starts with an introduction to information security concepts, security services and security mechanisms. In the second part, we discuss the concepts of symmetric and asymmetric cryptography, the hash function and the signature and key sharing procedures and we apply these concepts to secure the data communication using the SSL and the IPsec protocols. In the third part, we discuss security in wireless networks, intrusions and filtering mechanisms through the use of firewalls. Finally, we discuss security management and risk management concepts.                                                                                                                                                                                   |                                              |              |

| In this course, optical communication systems are introduced. Optical fibers are studied next (step-index, graded-index, multimode, single-mode) as well as signal propagation and degradation. Optical sources (LASER, LED) and receivers (PIN, APD) are then discussed, with the probabilistic theory behind receiver operation. Finally, the design of a complete optical communication system is considered, taking into account factors such as attenuation, error probability, SNR, and power constraints.                                                                                                                                                                                                                                                                                                                                                        |                                              |              |

| This course covers antenna, Radar and GPS principles. It starts with the parameters of antennas used for antenna analysis. These parameters include radiation power density, radiation intensity, directivity, efficiency, gain, bandwidth, polarization, impedance etc. Antenna arrays will be also presented. The course then tackles radar topics and principles including radar transmitter and receiver, radar equation, radar cross section of simple and complicated targets, blind range, ambiguity range in pulse radar, probability of detection, probability of false alarm etc. Doppler effect, pulse-Doppler radar and linear frequency modulation radar will then be detailed. Finally, satellite and GPS principles will be presented. |                                          |              |

| This course starts with an overview of information theory: discrete and continuous sources, source coding and channel coding theorems, channel matrix, channel capacity, Kraft inequality, lossless coding. Then, we study linear block codes and cyclic codes. Convolutional codes are then considered, including trellis diagrams, Viterbi decoding, etc. Turbo-codes are also studied (concatenation, interleaving, iterative decoding algorithms). We end with an introduction to LDPC codes.                                                                                                                                                                                                                                                     |                                          |              |
| <b>GRT560</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>Digital Image Processing</b>          | <b>3 cr.</b> |

| This course consists of an introduction to digital image processing as well as video compression. The first part covers image acquisition, sampling, and quantization, gray scale image transforms, histogram processing, spatial filtering, 2D Fourier transform, filtering in the frequency domain, image degradations, enhancement techniques, and mathematical morphology. The second part introduces video coding: spatial and temporal sampling, motion estimation and compensation, transforms (KLT, DCT, and wavelets), differential coding and predictive coding (intra and inter frames).                                                                                                                                                   |                                          |              |
| <b>GRT563</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>Video Compression</b>                 | <b>2 cr.</b> |

| This course aims at introducing advanced topics in communication to telecommunications engineering students. Students are first introduced to detection theory. Synchronization and equalization techniques are studied next. Fading channels are introduced, with emphasis on practical channel models and applications in the wireless world. The topics covered next are multicarrier systems, diversity techniques and MIMO systems.                                                                                                                                                                                                                                                                                                              |                                          |              |

| <b>Pre-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | GRT432                                   |              |
| This course starts with an overview of information theory: discrete and continuous sources, source coding and channel coding theorems, channel matrix, channel capacity, Kraft inequality, lossless coding. Then, we study linear block codes and cyclic codes. Convolutional codes are then considered, including trellis diagrams and Viterbi decoding. Turbo-codes are also studied (concatenation, interleaving, iterative decoding algorithms). We end by an introduction to LDPC codes.                                                                                                                                                                                                                                                         |                                          |              |
| <b>GRT566</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>Advanced Transmission Systems Lab</b> | <b>1 cr.</b> |

| The aim of the practical work is the implementation of the various theoretical concepts of networks modeling and processing. Problems and practical examples are examined using the ns simulator and the Matlab software.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                          |              |

| This lab consists of application of the concepts learned in the digital image processing and video compression course. The first part consists of an introduction to the image processing toolbox in MATLAB. Afterwards, image processing techniques will be studied, and spatial and frequency domain filtering, image restoration, as well as color image processing. Finally, a video signal will be studied.                                                                                                                                                                                                                                                                                                                                      |                                          |              |
| <b>GRT575</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>Mobile Communications Lab</b>         | <b>1 cr.</b> |
| <b>Co-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | GRT555                                   |              |

The purpose of this lab is to provide an introduction to mobile communications, starting with an introduction to the simulator ns-2. Then we study wireless transmissions, medium access protocols, cellular networks, WLAN, mobile IP, TCP in wireless environments, and some other mobile applications.

|                      |                             |              |
|----------------------|-----------------------------|--------------|
| <b>GRT576</b>        | <b>Network Modeling Lab</b> | <b>1 cr.</b> |
| <b>Co-requisites</b> | GRT552                      |              |

The aim of the practical work is the implementation of the various theoretical concepts of networks modeling and processing. Problems and practical examples are examined using the ns simulator and the Matlab software

|                       |                                 |              |
|-----------------------|---------------------------------|--------------|
| <b>GRT578</b>         | <b>Advanced Mobile Networks</b> | <b>3 cr.</b> |
| <b>Pre-requisites</b> | GRT431                          |              |

This course is an introduction to mobile communications, wireless transmission, medium access control, cellular radio systems, ATM architecture, Wireless LANs, mobile IP, and mobile TCP.

|                      |                                     |              |
|----------------------|-------------------------------------|--------------|
| <b>GRT579</b>        | <b>Advanced Mobile Networks Lab</b> | <b>1 cr.</b> |
| <b>Co-requisites</b> | GRT578                              |              |

The purpose of this lab is to provide an introduction to mobile communications, starting with an introduction to the simulator ns-2. Then we study wireless transmissions, medium access protocols, cellular networks, WLAN, mobile IP, TCP in wireless environments, and some other mobile applications.

|                       |                      |              |
|-----------------------|----------------------|--------------|
| <b>GRT581</b>         | <b>Internship II</b> | <b>1 cr.</b> |
| <b>Pre-requisites</b> | GRT596               |              |

After spending one to two months in a company, living the real-world professional experience outside the academic environment of the university, the students enroll in this course and submit a report containing all that has been learnt, the difficulties faced, and the correlation with the courses studied.

|               |                        |              |
|---------------|------------------------|--------------|
| <b>GRT596</b> | <b>Final Project I</b> | <b>1 cr.</b> |
|---------------|------------------------|--------------|

This course is the first half of the Final Year Project that each student must succeed in to obtain the engineering degree. The students are required to select a topic in telecommunications engineering or a related field, perform bibliographic study and propose solutions for further investigations.

|                       |                         |              |
|-----------------------|-------------------------|--------------|
| <b>GRT597</b>         | <b>Final Project II</b> | <b>3 cr.</b> |
| <b>Pre-requisites</b> | GRT596                  |              |

This course is the second half of the Final Year Project that each student must succeed in to obtain the engineering degree. The students are required to develop advanced studies on the topic selected in the course GRT596, finalize the proposed solutions and submit a detailed report of all the work done.

|                      |                                 |              |
|----------------------|---------------------------------|--------------|
| <b>GRT631</b>        | <b>Digital Image Processing</b> | <b>3 cr.</b> |
| <b>Co-requisites</b> | GRT671                          |              |

This course consists of an introduction to digital image processing as well as video compression. The first part covers image acquisition, sampling, and quantization, gray scale image transforms, histogram processing, spatial filtering, 2D Fourier transform, filtering in the frequency domain, image degradations, enhancement techniques, and mathematical morphology. The second part introduces video coding: spatial and temporal sampling, motion estimation and compensation, transforms (KLT, DCT, and wavelets), differential coding and predictive coding (intra and inter frames).

|               |                                 |              |
|---------------|---------------------------------|--------------|
| <b>GRT632</b> | <b>Antennas, Radars and GPS</b> | <b>3 cr.</b> |
|---------------|---------------------------------|--------------|

This course covers antenna and Radar principles. It starts with the fundamental parameters of antennas, then moves on to the radiation integral used for antenna analysis. Detailed examination of wire antennas and antenna arrays will be presented next. After the antenna part is done, the course tackles some radar topics like the Radar equation, Radar Cross Section (RCS) of simple and complicated targets, Range and Doppler ambiguity in pulse radar, probability of detection and probability of false alarm. A GPS overview will be covered at the end of the term.

|               |                                       |              |
|---------------|---------------------------------------|--------------|
| <b>GRT633</b> | <b>Advanced Communication Systems</b> | <b>3 cr.</b> |
|---------------|---------------------------------------|--------------|

This course aims at introducing advanced topics in communications to Telecommunications Engineering students. Students are first introduced to detection theory. Synchronization and equalization techniques are studied next. Fading channels are introduced, with emphasis on practical channel models and applications in the wireless world. The topics covered next are multicarrier systems, diversity techniques and MIMO systems.

|                       |                          |              |
|-----------------------|--------------------------|--------------|
| <b>GRT634</b>         | <b>Video Compression</b> | <b>2 cr.</b> |
| <b>Pre-requisites</b> | GRT631                   |              |

This course introduces video coding concepts with emphasis on the H.264 standard. Advanced topics such as distributed video coding, Multiview coding, and unequal error protection are also discussed.

|                      |                                        |              |
|----------------------|----------------------------------------|--------------|
| <b>GRT635</b>        | <b>Advanced Networks Architectures</b> | <b>3 cr.</b> |
| <b>Co-requisites</b> | GRT673                                 |              |

Students will study: internal routing protocols (RIP, OSPF, EIGRP); external routing protocol (BGP4), evolution; architecture of IP multicast and group management protocol (IGMP) and multicast routing protocols (DVMRP, PIM-SM, PIM-DM); IP networks multi-service, IP and Quality of Service (QoS); DiffServ and differentiated quality of service, architecture; IntServ, architecture and protocols; voice and telephony over IP; Optical IP/ MPLS and GMPLS (architecture, main concepts, traffic engineering); METRO Ethernet; VPN services evolution; VPN architectures (layer 2 and layer 3); mobility in IP networks (Internet and private); mobility mechanisms in IPv4 networks; IPv6 basic mechanisms; mobile IPv6; Hierarchical Mobile IP (HMIP); handover mechanisms based on IPv6; and overlay networks (caches, CDN and peer-to-peer).

|                      |                                     |              |
|----------------------|-------------------------------------|--------------|
| <b>GRT671</b>        | <b>Digital Image Processing Lab</b> | <b>1 cr.</b> |
| <b>Co-requisites</b> | GRT631                              |              |

This lab consists of an application of the concepts learned in the digital image processing and video compression course. The first part consists of an introduction to the image processing toolbox in MATLAB. Afterwards, image processing techniques will be studied, spatial and frequency domain filtering, image restoration, as well as color image processing. Finally, a video signal will be studied.

|                       |                                          |              |
|-----------------------|------------------------------------------|--------------|
| <b>GRT672</b>         | <b>Advanced Transmission Systems Lab</b> | <b>1 cr.</b> |
| <b>Pre-requisites</b> | GRT551 And GRT553 And GRT632             |              |

This lab provides experience of: practical work for antenna theory, fibre optics and telephony communications; antenna gain, polarization, impedance; fibre optic characteristics, laser diode, PIN; telephone systems, signaling, transmitter-receiver, TDM, PCM.

|                      |                                            |              |
|----------------------|--------------------------------------------|--------------|
| <b>GRT673</b>        | <b>Advanced Networks Architectures Lab</b> | <b>1 cr.</b> |
| <b>Co-requisites</b> | GRT635                                     |              |

Students will experience advanced routing techniques, IP Multicast, IP and Quality of Service, voice and telephony over IP, VPN, the mobility mechanism in IP networks, basic IPv6 mechanisms, and peer-to-peer networks.

**MAT207 Algebra for Engineers 1 3 cr.**

The course aims at providing the necessary tools and the mathematical maturity for engineers, for the design and analysis of abstract mathematical models. Subjects covered: complex numbers, logic and proofs, propositional calculus, sets and mappings, relations and ordered sets, an introduction to algebraic structures, groups, rings and fields, polynomials, counting, finite and transfinite cardinals.

**MAT216 General Mathematics 3 cr.**

This course provides the solid basics needed by students to be able to handle their specialty courses. Topics covered include: function of a real variable, elementary functions, Taylor's expansion, simple integral and methods of integration, differential equations, multivariable functions, continuity, partial derivative, the chain rule, differential, introduction to double integrals, methods of integration, matrix calculus, determinants, and linear systems.

**MAT217 Calculus for Engineers 1 3 cr.**

The course covers integration methods to compute integrals and improper integrals. We will study the infinite series, Taylor expansion, Parametric curves and Polar curves, and double integrals.

**MAT227 Calculus for Engineers 2 3 cr.**

**Pre-requisites** MAT217

This course teaches basic theory and techniques of Ordinary Differential Equations (ODEs). Topics include: solution of non-linear first-order ODE's; linear ODE's, especially second order with constant and variable coefficients; delta functions, convolution, and Laplace transform methods; power series and resolution of differential equations using power series; real and complex Fourier series; and an introduction to partial differential equations.

**MAT307 Algebra for Engineers 2 3 cr.**

**Pre-requisites** MAT207

The main objective of this course is to continue the study of algebra, covering mainly linear systems and matrices, matrix algebra, inverses, Gauss elimination, elementary matrices, computing inverses, determinants, vector spaces, definition and examples of spaces and subspaces, linear independence, basis and dimension, change of basis, linear applications, reduction of an endomorphism, eigenvalues, eigenvectors, characteristic polynomial, solving linear systems of differential equations, diagonalization and applications, bilinear and quadratic forms, Gauss method, scalar and cross product, Euclidean and Hermitian spaces, Gram-Schmidt Orthogonalization process, geometric transformations.

**MAT337 Calculus for Engineers 3 3 cr.**

**Pre-requisites** MAT217

The main objective of this course is to continue the study of calculus, covering mainly parametric and polar curves, three dimensional analytic geometry, differentiation and integration of functions of several variables, and vector calculus. Line integrals, and Green's theorem are also covered.

**PHY210 General Physics 3 cr.**

The objective of this course is the introduction of various laws, principles and physical mechanisms, whose understanding is essential to students in pursuing their studies in all branches of science. This course consists of several independent parts. The first one deals with dynamics, the different types of motion, Newton's laws, and conservation of energy. The second part deals with hydrostatics and fluid dynamics. The third part deals with the thermodynamics, calorimeters, the first principle and the basic transformations, the ideal gas, and thermodynamic cycles. The fourth part concerns the analysis of simple electrical circuits using Kirchhoff laws and the movement of a particle in an electromagnetic field. Finally in the fifth part we talk about relativity, the theory of photons, and the photoelectric effect. Upon completion of this course the students will have acquired sufficient knowledge of several basic principles in physics and be familiar with these topics.

**STA307 Probability and Statistics for Engineers 3 cr.**

**Pre-requisites** MAT217

This course aims to provide students with the most common concepts of probability theory and statistical inference, with a unique balance between theory and methodology. Interesting relevant applications using real data will be used to show how the concepts and methods can be applied to solve problems in the different fields of engineering in practice.

**STA515 Statistical Analysis Methods 3 cr.**

The purpose of this course is to strengthen the knowledge of students in the field of applied statistics by minimizing the mathematical approach and developing practical and methodological aspects. It presents the main techniques of most known statistical tests (descriptive and inferential statistics, explanatory methods, and data analysis). The course provides an overview and practical techniques in the main methods available in software, and an aid to the interpretation of the results and fully processed examples using the statistical software program SPSS. Most of the themes will be covered by this course, including the analysis of Variance (ANOVA test), comparisons of samples (t-test & Chi - square), single and multiple regression.

**STA220 - STS220 Applied Probability and Statistics 3 cr.**

This course prepares students for the practical use of probability and statistics in the biomedical field (agronomy, chemistry, biochemistry, nutrition, medicine, etc.). Topics to be covered are: elements of descriptive statistics, population, statistical units, frequency distribution, and characteristics of central tendency and dispersion. The course also covers these aspects in detail: probability and combinatorics, conditional probability and Bayes' formula, applications, discrete and continuous random variables, expectation and moments, the weak law of large numbers, empirical frequencies and basic probability laws (Binomial, Multinomial, Poisson, Normal) and asymptotic behavior, the law of large numbers, sampling and estimation, and an introduction to the use of hypothesis tests, and the Chi-2 contingency table.

**MGT220 Principles of Management 3 cr.**

**Pre-requisites** ENG140

An introductory course that explains the definition of management as a set of activities, including planning and decision-making, organizing, leading, and controlling, directed at an organizations resources, including the human, financial, physical, and informational, with the aim of achieving organizational goals in an efficient and effective manner.

# School of Law and Political Sciences

## Overview

USEK School of Law and Political Sciences was inaugurated on November 10th, 1988, on the 40th anniversary of the Universal Declaration of the Human Rights. From its beginnings, the School of Law and Political Sciences has always offered its students an exceptional education that consolidates the strength of tradition with the dynamism of the modern world.

The School of Law and Political Sciences is indeed heir to a long history. The Lebanese Maronite Order, since its foundation, provided its monks with a solid education in canonical law, and has progressively extended its teaching to all legal disciplines for its monks and the Lebanese public. This diversification, based on the educational needs of Lebanese society, has allowed the School of Law and Political Sciences to build on past experiences while opening up to modernity.

Initially based in Byblos, the School of Law and Political Sciences relocated to the central campus of Kaslik in the fall of 1999, to accommodate the rise of the number of its students and to allow them to integrate with other University students and experience campus life to the full. The School also has a Regional University Center (RUC) in Zahle. Since 2016, it has hosted the Higher Institute of Political and Administrative Sciences, for students who wish to prepare themselves for management careers in government, public service, governmental agencies and nonprofit organizations.

The School of Law and Political Sciences proposes a full offering of legal education that includes a Bachelor in Law, a selection of master's degrees, and a doctoral degree. Its programs are offered in both French and English. Its school members include highly knowledgeable law professors and renowned professionals such as prominent judges, lawyers, and civil servants practicing in several administrations.

The School of Law and Political Sciences not only provides a learning experience but aims to develop the personal qualities of its students through its many extra-curricular activities such as mock trials, international pleading competitions, vis moot competitions in international arbitration, and clinical trainings. Most importantly, these experiences are designed to provide students with knowledge and skills to prepare them for the job market, locally and internationally.

It is an era of global legal practice and USEK School of Law and Political Sciences is committed to preparing its students by offering opportunities for transnational experiences, by actively recruiting international scholars (from France, Italy, USA, Canada), by developing student options for studying abroad within the Erasmus Plus program (typically in Greece, France, Belgium, Germany, Great Britain, or USA), and by building partnerships with reputable foreign universities, such as the Robert McKinney School of Law of Indiana-Purdue University for the delivery of a LL.M. in International and Comparative law, and more recently, with the Syracuse University School of Law in New York.

In addition, the School of Law and Political Sciences offers, through programs implemented in Lebanon, double master degrees, from France and Lebanon, such as the Master 2 in International Contracts offered in conjunction with the University of Montpellier I where students are awarded a Master 2 degree from USEK and a Master 2 degree from the University of Montpellier I, and a Master 2 in Business Law (Juriste d'affaires) in conjunction with the University of Poitiers where students are awarded a Master 2 degree from USEK and a Master 2 degree from the University of Poitiers.

Affiliated to the School of Law and Political Science, the Higher Institute of Political and Administrative Sciences, was created in February 2006 (decree no 16410), to train future officials in public administration and civil society, who are mindful of community spirit and ethics. The Institute contains three multidisciplinary educational fields, those of political sciences, international relations, and public administration. These aim to:

- Provide students with a specialized education in political sciences, thus giving them access to a professional life.
- Develop students analytical and synthesis spirit, thus enabling them to understand national and international issues.
- Prepare students to follow a specialized higher education curriculum.

### **Mission**

The mission of the School of Law and Political Sciences is to provide students with the opportunity to develop specialized knowledge in all areas of law by offering high quality programs that comply with the national and international standards. In an era of global legal practice, USEK School of Law and Political Sciences offers its students several opportunities for transnational experiences, by actively recruiting international scholars and building partnerships with reputable foreign universities.

The School of Law and Political Sciences consists of the following departments/programs:

#### **Department of Law**

- Law Degree
- Minor in Human Rights
- Minor in Public Administration: Public Law and Administrative Organizations of Lebanon
- Master of Arts in Criminology
- Master of Laws in Private Law
- Master of Laws in Public Law
- Master of Laws in Business Law
- Master of Laws in International and Comparative Law
- Master of Laws in International Contracts
- PhD in Law

#### **Department of Political and Administrative Sciences**

- Bachelor of Arts in Political Sciences
- Bachelor of Arts in International Relations
- Minor in Middle Eastern Studies
- Master of Arts in Diplomacy and International Security
- Master of Arts in Middle Eastern Studies
- Master of Arts in Political Sciences
- Master of Arts in Political Sciences - International Relations

## Administration and Full-time Faculty

Fr. Dr. Talal Hachem, Associate professor, **Dean**

Dr. Ghada Karam, Associate Professor, **Associate Dean**

### ***Associate Professors:***

Dr. Celine Baaklini

Dr. Ghada Karam

Fr. Dr. Haitham Sakr

Dr. Matthew Gerth

Fr. Dr. Talal Hachem

### ***Assistant Professors:***

Dr. Bechara Karam

Dr. Dominik Hamm

Dr. Eduardo Wassim Abou Ltaif

Dr. Reine Daou

Fr. Dr. Wissam Khoury

## Undergraduate Programs

### Bachelor of Arts in International Relations (Hybrid<sup>i</sup>)

#### Mission

The mission of the Department of Political and Administrative Sciences is to train students in the theories, applications and methods to analyze main contemporary issues that shape the relations between state and non-state actors. The Department offers a solid formation on how the practices of international relations shape who gets what and how, and who is who in the international political system. The department offers a solid and well-tailored formation that gives students the ability to understand the main diplomatic interactions, modalities of foreign policy, rivalries and alliances formation. The program also emphasizes on the strong understanding of the main strategies within power competition, geopolitical dynamics and the linkage between different subfields of political science, international relations, geopolitics, security studies, etc. As such, the program focuses on the following topics:

- Role displayed by state actors and non-state actors
- International, diplomatic and constitutional law
- Theories of international relations and geopolitics
- Geopolitical competition between regional powers and great powers
- Main contemporary challenges (hyper-globalization, terrorism, climate change, energy insecurity, migrations, etc.)

#### Program Educational Objectives

Program aims for students:

1. A deep understanding of the foundations of international relations and the inter-relationship between countries.
2. A strong comprehension of the theoretical foundations of foreign policy analysis, geopolitics and international organizations.
3. A strong ability to research, write and analyze modern and contemporary international issues (challenges of globalization, regional dynamics of the Middle East, geopolitical risk analysis, international security and terrorism).
4. A strong background in international affairs to pursue a diplomatic career by preparing students to take on the diplomatic exam of the Ministry of Foreign Affairs and Emigrants.
5. Strong competencies in negotiation, mediation and conflict resolution.

#### Program Outcomes

Students who complete the full requirements for a B.A. degree in International Relations will have the ability to:

1. Analyze and dissect key international issues in addition to fully understanding how state and non-state actors interact.
2. Write coherent and structured papers on modern international issues by using the theoretical foundations of international relations, foreign policy and geopolitics.
3. Efficiently use a comparative approach to contemporary global political issues.
4. Understand and explore the institutional foundations of Western and non-Western political thought
5. Engage internationally, study abroad or obtain an internship that enhances inter-cultural relationships and strengthens global citizenship.

#### Degree Requirements

This program requires 96 credits for students entering at the sophomore level (holders of freshman or a recognized baccalaureate - equivalent to 30 credits), distributed as following:

|                                                             |           |

## Bachelor of Arts in Political Sciences (Hybrid<sup>i</sup>)

### Mission

The mission of the Department of Political and Administrative Sciences is to train students in the analysis of the main public policies and its impact on the society in order to analyze the relations of power within a society. The department offers a solid academic preparation in social sciences that is characterized by theoretical and methodological diversity and by inter and multidisciplinary work. Likewise, promotes the training of competent leaders and professionals, with critical thinking skills and mastery of their discipline, with ethical values, sensitivity, and tolerance of human and socio-cultural diversity, and committed to the

<sup>i</sup> Hybrid: Courses offered in French and/or English

welfare of society. Therefore, the main goal is to provide our students with the basic theoretical and methodological tools in the field of political science to be capable of understanding and explaining the political environment and the main sociopolitical dynamics that affect politics at its different levels. In order to reach this goal, the Department of Political and Administrative Sciences is offering a program focused on the following topics:

- Middle Eastern political systems, with special attention to the Lebanese case study
- Public affairs, public institutions, constitutional law
- Political communication.
- Comparative politics.
- History of political thought
- Contemporary political theories.

### **Program Educational Objectives**

Program aims for students include:

- 1- A deep understanding of the essential principles and theories of politics to include the structure of government, forms of political participation, and public policy processes.
- 2- A deep comprehension and appreciation of contemporary political issues and their effects on the modern political landscape.
- 3- The development of a strong ability to research, dissect and analyze key political issues by using political science methodology and essential theoretical foundations.
- 4- An understanding of the basic political theories, ideologies, systems and behaviors.

### **Program Outcomes**

Students who complete the full requirements for a B.A degree in Political Sciences will have the ability to:

- a. Clearly write and with purpose on domestic political issues and analyze political and policy problems to formulate policy recommendations.
- b. Actively participate as civically engaged members of society.
- c. Demonstrate a strong foundation in critical thinking, forming arguments, detect fallacies and collect evidence on key local and national issues.
- d. Show competency with the essential methodologies that underlie modern social science research foundations, which include statistics and qualitative analysis.
- e. Deliver well-articulated presentations on research findings while discussing key major concepts and theories of political science.

### **Degree Requirements**

## Law Degree (Hybrid<sup>i</sup> & Eng.)

*Offered in Main Campus Kaslik, RUC Zahle and RUC Chekka*

### Mission

The mission of bachelor program in Law is to prepare a diverse community of students to be national and international leaders in private legal practice, business and industry, government service, and legal education. We believe that rigorous, comprehensive academic instruction is essential for a student to develop the proper capacity of critical and ethical judgment. We also seek to promote the professionalism of legal and paralegals, thereby enhancing their capacity for service to the legal community and ultimately contributing to the advancement of the justice in Lebanese society. Thus, the mission of the law school is to graduate students, undergraduate and graduate students who excel in the field of the judiciary, the bar, diplomatic careers, notaries, public service, international organizations and institutions, teaching, etc.

### Program Educational Objectives

1. Graduates will be able to pass various exams: entrance exam for the Magistrates' School, the bar exam, civil service and international diplomacy exam, notarial exam, etc.
2. Graduates will be able to have an effective, ethical and responsible participation in the legal profession.
3. Graduates will be able to continue their studies in the Master's program.

### Program Outcomes

Students will acquire:

- a. An ability to know and understand the importance of the rule of law, the principles governing its development and application, the essential steps for the development of the law, its contents, and the impact of international standards on its promotion.
- b. An ability to assess the application of a law and to provide adequate solutions to a legal problem.
- c. An ability to communicate in a clear, precise and structured manner the result of a legal analysis, in absolute respect of the rules governing scientific production.

<sup>i</sup> Hybrid: Courses offered in French and/or English

- d. An ability to question the choices of the rules, and to get involved in the promotion of the founding values of law.

## Academic Minors

### Minor in Human Rights (Hybrid<sup>i</sup>)

#### Mission

The minor in human rights is an option for students who are interested in this rapidly emerging field. The curriculum reflects the growing interest in human rights throughout the world – even as violations persist, and debate continues over the meaning and understanding of human rights. Many of the courses in the minor have an international approach. This program helps to prepare students for a career in research, working in NGOs that advocate for and monitor human rights compliance, or government agencies.

#### Program Educational Objectives

1. In the minor, students receive interdisciplinary instruction in domestic and international issues relating to human rights and civil liberties.
2. Students will have the opportunity to explore the history and structure of formal human rights and international law.
3. Students will have the opportunity to study a large number of historical or contemporary human rights struggles.
4. Students will develop a deeper understanding of the impact of international legal practices and organizations.

#### Program Outcomes

- a. Understanding the key functions and significance of human rights and international justice in the international legal order.
- b. Acquiring a solid knowledge of international human rights procedural and substantive norms and related institutions.
- c. Acquiring the skills to identify national and international violation in the context of case study on alleged prohibited conducts.
- d. Analyze and assess critically contemporary challenges related to international human rights.

#### Minor Requirements

| DRG395 - International Human Rights     | 2         |
| DRG225 - International Public Law       | 3         |
| DRG463 - International Criminal Law     | 3         |
| <b>Total</b>                            | <b>15</b> |

### Minor in Middle Eastern Studies (Hybrid<sup>ii</sup>)

#### Mission

The mission of the minor in Middle Eastern Studies is to provide the student with a comprehensive perspective and an analytical understanding of Middle East politics and of major regional issues and challenges.

#### Program Educational Objectives

1. Students will have an understanding of the current political issues in the Middle East as well as the elements shaping these issues.
2. Students will be able to leverage their acquired knowledge of the Middle East in multiple work sectors whether private or public.
3. Student will be able to analyze the contemporary regional political dynamics of the Middle East and their impact on the lives of its inhabitants.

<sup>i</sup> Hybrid: Courses offered in French and/or English

<sup>ii</sup> Hybrid: Courses offered in French and/or English

**Program Outcomes**

- Students will understand the main patterns and key issues shaping the modern and contemporary history of the Middle East.
- Students will understand the nature and main characteristics of the Arab regimes and the elements influencing the functioning of these regimes.
- Students will be able to identify and assess the main determinants as well as their impact on key geopolitical dynamics in the Middle East.
- Students will be able to understand the main conceptual, intellectual and cultural underpinnings of the ideologies that greatly influence Middle Eastern politics.

**Minor Requirements**

## Minor in Public Administration: Public Law and Administrative Organizations of Lebanon (Hybrid<sup>i</sup>)

**Mission**

The Minor in “Public administration: Public Law and Administrative Organizations of Lebanon” is designed to provide students with an overview of employment in government, public service, and administrative organizations.

The public administration minor introduces students to core concepts in the field and provides students with the opportunity to develop specialized knowledge in the areas of organizational behavior, management, budgeting, and public policy.

This minor is appropriate for students planning careers in government, public service, governmental agencies and nonprofit organizations. The public administration minor also provides a foundation for continued studies in public administration, law, and international diplomacy.

**Program Educational Objectives**

- Students studying “Public Administration” will gain a greater understanding of the public sector and the management of its agencies.
- In this Minor, students learn about the policy process as well as specific government functions such as budgeting and personnel.
- The Minor will provide knowledge and skills for students who wish to prepare themselves for management careers in government, community agencies, private not-for-profit organizations, planning and consulting firms, and private sector organizations that work in partnership with the public sector.

**Program Outcomes**

- Identify the core mechanisms of public administration, including the organization and management of human and financial resources.
- Discuss the political, economic, legal, and social environments of public policy and administration.
- Explain the unique challenges and opportunities of providing public goods and services in a diverse society.

**Minor Requirements**

### Master of Arts in Criminology (Hybrid<sup>ii</sup>)

#### Mission

The Master of Arts in Criminology endorses a special mission: to make a better world of democracy. It means that master students take responsibility for developing a critical criminological thought process that is necessary for a democracy to be a home for security and fraternity.

<sup>i</sup> Hybrid: Courses offered in French and/or English

<sup>ii</sup> Hybrid: Courses offered in French and/or English

### Program Educational Objectives

1. Lawyers and non-lawyer graduates in criminology will be able (a) to engage in research in criminology; (b) to effectively participate in the penal legal profession, and (c) to effectively participate in rehabilitating criminals in general, and prisoners in particular.
2. Lawyers graduates in criminology will be able to assess the level of a defendant's criminological threat, with the aim of fixing equitable penalties: (a) as criminal judges (proving that the degree a defendant's criminological threat is high), either at prosecution level (general prosecutor), or at investigation level (investigating judge, indictment division), or at judgment level (assizes court or at all degrees of criminal jurisdictions for misdemeanors) ; (b) As criminal lawyers: proving that the degree of the client's criminological threat is not high, and (c) as judiciary police: to be able to detect the criminological threat.
3. Non-lawyer graduates in criminology will have the ability to become (a) assistants to criminal judges or lawyers, and to assess a defendant's criminological threat; (b) Assistants to medical examiners to participate in operating medico-legal autopsies; (c) Assistants to medical experts in courts, to assess a defendant's or victim's mental health; (d) assistants to psychologists, psychiatrists or sexologists to study a defendant's or victim's mental health, and (e) activists in non-- governmental organizations in fighting violence, sexual abuse, sexual harassment, etc.

### Program Outcomes

- a. Students will acquire the ability to draft detainee assessment briefs.
- b. Students will acquire the ability to submit projects of law or bills for the prevention of crime.
- c. Students will acquire the ability to draft criminals' mental health assessment.
- d. Students will acquire the ability to assist in medico-legal autopsies.

### Degree Requirements

*The minimum passing grade for all graduate law courses is 80/100.*

## Master of Arts in Diplomacy and International Security (Hybrid<sup>i</sup>)

### Mission

The Department of Political and Administrative Sciences offers this advanced graduate program to provide students with the ability to critically analyze the complexities of world politics and international affairs. It is tailored to equip students with a deep knowledge of the most important sub-fields and modern issues within the discipline such as geopolitics, globalization, human rights, economic development and security.

### Program Educational Objectives

<sup>i</sup> Hybrid: Courses offered in French and/or English

1. Graduates will demonstrate the ability to critically and deeply evaluate the complex political dynamics of world affairs.
2. Graduates will strongly learn to assess, manage and ultimately mediate cases of conflict.
3. Graduates will develop their oral and written skills to communicate in the context of diplomacy and international security.
4. The program aims to train students to work in governmental agencies, intergovernmental organizations, non-governmental organizations, and multinational corporations.

#### Program Outcomes

- a. Students will possess the strong knowledge to address various political, geographical, and cultural issues on the international stage.
- b. Students will re-frame the issues that encompass the international conflicts. They will be able to design and implement conflict resolution strategies.
- c. Students will adapt the tools and techniques of oral and written communication to the specific needs of diplomacy and negotiation processes.

## Master of Laws in International Contracts (Hybrid)

### Mission

The Master of Laws in International Contracts at the USEK School of Law and Political Sciences, in partnership with the Faculty of Law of Montpellier I University, aims to offer its students in-depth training in international contracts law.

### Program Educational Objectives

Graduates will have:

1. Advanced legal knowledge in the field of international contract law and related provisions of public and private international law.
2. Enhanced competencies for comparative legal analysis.
3. Fundamental tools and competencies needed to deal with the complex reality of international commercial transactions from an international perspective.
4. Essential skills in legal research, analysis, and communication for understanding and applying business and contract law in a transnational legal environment.

5. Knowledge and skills to pursue employment with transnational corporations, commercial law firms, governmental and nongovernmental agencies.

**Program Outcomes**

- Students will be familiarized with and deepen their knowledge in international trade and master contract drafting.
- Students will be familiar with techniques of contract drafting for international trade.
- Students will gain experience in research methodology specifically designed for contract law.

**Degree requirements**

*The minimum passing grade for all graduate law courses is 80/100.*

## Master of Laws in Private Law (Hybrid<sup>i</sup>)

**Mission**

The aim of the Master II in Private Law is to deepen students' knowledge in private law matters, predominantly in civil law, whose concepts and techniques forged the common ground of private law matters. Indeed the objective of this program is to train highly motivated professionals who are dynamic, inventive, creative and most importantly able to analyze complex information and dossiers.

**Program Educational Objectives**

- Graduates will be able to pass various exams: entrance exam for the Magistrates' School, the bar exam, civil service and international diplomacy exam, notarial exam, etc.
- Graduates will be able to have an effective, ethical and responsible participation in the legal profession.
- Graduates will be able to pursue a doctoral program.

**Program Outcomes**

- Students will acquire an ability to mobilize and enrich, in a critical spirit, the knowledge and skills acquired at the end of the Bachelor of Law program.
- An ability to master the content of the main rules of substantive law in all its branches, as well as those of international law, to compare the essential features of some foreign systems, and be able to move from the abstract to the rule of law to the facts, even if they are presented in complex ways, and vice versa.
- An ability to skip easily from the rule to the facts, and vice versa, during a discussion, communicate the result of research and legal analysis in a clear, precise, structured and persuasive manner, and produce a legal study, with absolute respect to the governing scientific rules.

---

<sup>i</sup> Hybrid: Courses offered in French and/or English

- d. An ability to update knowledge, perceive bridges between the different branches of law, to form personal opinions and, if necessary, to build on the opening resulting from an internship or an exchange trip.
- e. An ability to question the choices of the rules, getting involved in the promotion of the founding values of the law and organizing its work.

#### Degree Requirements

## Master of Arts in Middle Eastern Studies (Hybrid<sup>i</sup>)

### Mission

The Department of Political and Administrative Sciences offers this program in a well-tailored package that focuses on the Middle East. The program provides a strong understanding of the regional dynamics of the Middle Eastern region, as well as the nature the regimes, history and policymaking of its states.

### Program Educational Objectives

1. The program aims at promoting a strong understanding of the complex politics of the Middle East so that students can become effective policymakers.
2. The program aims for graduates to have a better understanding of the different cultures that compose the Middle East and thus promote inter-cultural relationships through their works.
3. The program emphasizes on providing students with the necessary professional skills, tools and information to work in the various public and private sectors of Middle Eastern states.

### Program Outcomes

- a. Students will understand the main determinants the foreign policies of regional and great powers toward the Middle East. As such, through their given theoretical framework, they will be able to assess and present solutions for the political problems of the region.
- b. Students will understand the historical roots of controversial issues and ongoing debates, including Arab-Israeli relations and power competition.
- c. Students will gain specialist knowledge in the political and economic context of the Middle East. As such, they will be able to write in peer-review journals and conferences on subjects that concern the region.
- d. Students will understand new dynamics at play in the post-Arab revolutions in the Middle East, including the role of NGOs, civil society and the media, the rise of transnational non-state actors like Daesh and the Kurds, and the return of the “Deep States”.

<sup>i</sup> Hybrid: Courses offered in French and/or English

## Master of Laws in International and Comparative Law (English)

### Presentation

The specialized LL.M. in International and Comparative Law is offered with an emphasis on corporate, business, and trade law. It provides intensive academic training in the regulation of US and global business activity. LL.M. students take all their classes with international professors, taught by some of the leading US experts in financial, corporate and transactional law.

The structure of the academic program ensures access to a broad and balanced curriculum and an exceptionally rich selection of courses in international business and trade law, various American law courses including bankruptcy, securities regulation, and numerous specialized seminars. Students are afforded a unique opportunity to earn two law degrees: a Master in Law from USEK and an American Master of Laws (LL.M.) degree from Robert H. McKinney School of Law.

### Program Educational Objectives

1. Gain practical and theoretical knowledge in selected areas of international and comparative law, with an emphasis in international business and commercial law.
2. Learn the skills of legal research, analysis, and communication essential to understanding and applying international law and succeeding as a professional in this area.
3. Build an international network of professional contacts.

### Program Outcomes

- d. Deepen their knowledge in selected areas of international and comparative law
- e. Learn the skills of legal research and analysis
- f. Build essential communication skills especially in English

### Degree requirements

*The minimum passing grade for all graduate law courses is 80/100.*

| This course provides tools for policy analysis, a central theme in political science. The analysis of public policy helps to identify practical and ideological conditions in which publication is developed, formulated and implemented. It combines the practical instruction of general administrative law based on various case studies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                    |              |
| <b>ADP552</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>Constitutional Law and State Theories</b>                       | <b>3 cr.</b> |
| This course offers a critical and comparative approach to constitutional law and the theory of the state, based on various case studies. Its content is structured around the questioning of the notion of state in Lebanon and the Arab countries, with regard to the sources of norms production and policies and legislative practices, in comparison with historical experiences the West has known, and other regions of the world (Indian subcontinent, Latin American world).                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                    |              |
| <b>ADP554</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>Sustainable Development and Resource Management</b>             | <b>3 cr.</b> |
| Sustainable development is a current topic which is investing more and more public action in the management of natural, cultural and historical resources. This course offers both practical and theoretical instruction, for putting into practice in the Lebanese and regional situation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                    |              |
| <b>ADP556</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>Federalism, Decentralization and Regional Cooperation</b>       | <b>3 cr.</b> |
| Federalism and decentralization are issues of debate in many countries including Lebanon. This course aims to provide students with practical knowledge through the study of case studies along with theoretical tools related to these fields.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                    |              |

| The course studies criminal phenomenon in its constitutive elements, including crime, This course examines the nature, object, and necessity of criminal creology: the creologic study of crime. Students will consider the theory of "human act in se"; shifting the study of crime from without to within human act per se, the compatibility and incompatibility of creative activity and criminal activity. This course will also study criminal creologization: a creative activity as a criminological factor, creative activity and development of psychological and psychiatric characteristics of criminal personality. Finally students will learn about levels of creological dangerous and criminological threats.                                                                                                                                                           |                                                                    |              |
| <b>CRM513</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>Questions of Ethics in Criminology</b>                          | <b>3 cr.</b> |
| The aim of this course is to enable the would be criminologists to become acquainted with the fundamental knowledge of medical ethics and to encourage them to think critically in a context related to ethical criminology. Facing a complex medical situation, the appropriate reaction is not always easy to determine. It is usually decided in reference to concepts that people have. This course, on the basis of specific themes, will help students to think, understand, criticize, compare, analyze and draw conclusions, thus enabling them make better decisions when decisions are not easy to make.                                                                                                                                                                                                                                                                       |                                                                    |              |
| <b>CRM514</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>Psychological Criminology</b>                                   | <b>3 cr.</b> |
| This course will enable students to integrate psychological theories in order to understand the criminal phenomenon, to acquire the basic concepts of different theories and to become operational within the practice of research and future considerations. This course will also examine several clinical cases to illustrate and help students understand both the psychology of the person who committed a crime and the victim.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                    |              |

| Sociologists are interested in how society is created and how human beings form social relationships and interact with each other. Criminology is a related discipline that examines "crime" and "deviance", and the processes through which the criminal justice system responds to these phenomena. Studying Sociological criminology will provide a sound understanding of the key conceptual and substantive issues involved in the study of society, crime and criminal justice.                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                    |              |
| <b>CRM516</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>Forensic Medicine I</b>                                         | <b>3 cr.</b> |
| This course helps students to understand human thoughts and the consequences of pressure, know the basic ideas in forensic medicine, learn about the Lebanese legislation (law, decree), their rights and responsibilities, and know how to judge the quality and authenticity of an expert report. The course will also cover medico-legal study and dating of violence lesions, examination of a dead body, levee body, and importance of autopsy contribution and medico-legal expertise.                                                                                                                                                                                                                                                                                                                                                                                             |                                                                    |              |

| Criminal threat is often associated with mental disorders. Recent studies using standardized diagnostic instruments confirm this relationship. Compared to the general population, the arrest rate of patients with mental disorders is significantly higher. Incarcerated persons suffer from more psychiatric disorders. Psychotic disorders, in particular schizophrenia with hallucinations and delusions, antisocial personality disorder and addiction disorders increase the risk of a person committing homicide. Epidemiological studies confirm that various DSM5 mental disorders significantly increase the prevalence of violent behavior. The higher the psychiatric comorbidity, the higher the risk of aggressive behavior and suicide.                                                                                                                                  |                                                                    |              |
| <b>CRM612</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>Forensic Medicine II</b>                                        | <b>3 cr.</b> |
| This course focuses on the study of medico-legal activities in matters of criminal law, and of civil law. With regard to the first type of activities, this course examines findings of physical, psychic and sexual violence, identification of the author of crime, age determination, amenability to detention, investigating alleged cases of torture, forensic psychiatry criminal expertise, etc. With regard to the matters of civil law, Forensic Medicine II concentrates on various studies, such as evaluation of suspected physical injury, guardianship, expertise in medical liability, etc. Students will learn to analyze medico-legal case studies that cover both criminal and civil law issues, such as murder, suspect death, victimology, sexual offences, abuse of children, collective criminology, testimony in court, information about driving abilities, etc. |                                                                    |              |
| <b>CRM613</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>Forensics</b>                                                   | <b>3 cr.</b> |
| This course will focus on the work of forensic experts and tribunals, fire and explosion forensic investigation, fingerprint identification (dactyloscopy), and bone identification (osteology).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                    |              |
| <b>CRM614</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>Current Events in Criminology</b>                               | <b>3 cr.</b> |
| Students, researchers and practitioners participate in addressing questions on criminology relating to Lebanese, Arab, and World current events.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                    |              |
| <b>CRM680</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>Internship in Criminology</b>                                   | <b>3 cr.</b> |

Students will complete an internship with a medico-legal institute, a psychiatric hospital, a prison, etc. in Lebanon or abroad.

**CRM690A End of Studies Project 3 cr.**

Criminology students are required to prepare a project, either theoretical or practical, at the end of their Master. It will be published in the USEK Journal of Criminology.

**DIS530 Strategic Studies: Issues of War and Peace 3 cr.**

The objective of this seminar is to provide students with a necessary introduction to the understanding of current debates on the threats of security order and the importance of strategic studies. The first part of the seminar provides an introduction to theoretical interpretations of strategic studies and international security. In the second part, the seminar deals with general issues such as causes of war, defense diplomacy, homeland security, use of force, alliances, security cooperation, revolution in military affairs, current transnational threats, etc. The seminar seeks to explain the importance of strategy in the current issues of peace and war. To do so, the seminar presents several case studies to link the theory with the practice.

**DIS535 Foreign Policy Analysis 3 cr.**

The seminar focuses on the comparative study of foreign policy. It addresses the foreign policies of Great Powers, medium sized Powers and regional Powers. It starts by a theoretical and empirical analysis of the decision making system in these countries, as well as the patterns of foreign policies.

The comparative analysis is also focused on the elements shaping FP decision making and conduct of foreign policy (the different components of the external and internal factors shaping the decision making). Particular emphasis will be put on their foreign policies in the Middle East.

**DIS550 Diplomacy and Risk Analyses in Current Geopolitics 3 cr.**

The analysis of how diplomacy reflects the fact that political decisions are conditioned by geographical settings is extremely important for understanding the link between international relations and geopolitics. In purely spatial terms, geopolitics is the study of boundaries and areas. In conceptual terms, geopolitics comprises the study of international relations and the outcome of power struggles, at local and global scales. It explores events such as the emergence of new states, the fragmentation of countries (e.g. the former Czechoslovakia, and the former Yugoslavia), and regional conflicts affecting several countries. The main objective of this course is to provide students with the theoretical tools to analyze the geopolitical risks, and to the special role that geopolitical events play in asset prices; it also aims to provide you with tools to make better practical use of general geopolitical and diplomatic awareness and with frameworks to think through the "breaking news".

The course has two parts. Part one introduces key ideas of geopolitics and diplomacy and provides basic tools to analyze geopolitical risk events.

These tools are largely drawn from the world of elementary political and intelligence analysis. As you will discover (repeatedly) in class, to analyze is not always to quantify (and vice versa). In the most practical way, Part one is to help you "Think about thinking" and teach you how to avoid common errors in reacting to geopolitical, news, events and trends. Part two then offers you a chance to practice the styles of thinking and tools acquired in part one.

**DIS555 Diplomacy and International Migration 3 cr.**

These are the countries of the southern hemisphere that supply the bulk of international migration flows. Several Western countries emphasize their security policies related to the international mobility. However, it is commonly accepted that if there were no borders, there would be no migrants. This seminar highlights the link between the phenomenon of migration, which creates security problems and various diplomatic strategies put in place for its management.

**DIS560 Diplomatic Management of Energy Security in the Middle East 3 cr.**

The course focuses on the oil and Gas policies in the region and the role these sources of energy and others played in shaping and influencing the regional agenda, the configuration of power in the region and the international politics of the Middle East. It addresses also the different impact on the oil producing states mainly the emergence of rentier economies.

**DIS565 Actions and Humanitarian Law 3 cr.**

International humanitarian law is a set of rules designed to limit the effects of armed conflicts. It protects persons who are not taking part in hostilities. This seminar examines the development and implementation of international treaties and conventions, through an approach that is both theoretical (legal standards) and practical (diplomatic action, action on the ground). It attempts to answer the question to what extent international humanitarian law is able to protect the victims of armed conflicts.

**DRG210.1 General Constitutional Law 3 cr.**

The course presents the concepts of constitutional law based on two main ideas: authority and freedom. This vision is founded according to the bodies constituting the public powers, their functions and their relationships between each other and the governed population

**DRG216 Legal Methodology 3 cr.**

The law students will encounter several exercises that require different methodologies. The purpose of this course is to raise and increase the legal reasoning of students which will help them to find suitable solutions to different law cases; such as, legal dissertation, judgment file, decision commentary, practical cases. In addition to several assignments on each topic, this course aims to stimulate legal research and gain familiarity with the library where students will learn to research texts of law, jurisprudence and doctrine. Finally, the legal methodology is mainly based on legal logic, which is a way of reasoning translated by a chronological sequence of ideas leading to a certain solution. So the legal methodology is a way of searching for documents, references, judgments and legal decisions in order to analyze them, and discuss them logically.

**DRG217 Legal Communication 2 cr.**

"Communication Juridique" teaches students the practice of written and spoken French in a legal context. This course aims to develop the students' legal knowledge and to fill their linguistic gaps. Its main objective is not only to enable students to understand the information in a legal document, but also to combine the vocabulary with grammar in order to allow them to communicate better.

**DRG220.1 Family Law I 2 cr.**

**Prerequisites DRL228.1**

The Family Law I course is an introduction to European family law, the French one is particular looked at. Sources and history of family law are offered. In addition, students learn about training conditions, effects, evidence and divorce: causes, procedure, and effects, as well as legitimate filiation: maternity and paternity legitimate, evidence, and the disallowance paternity.

**DRG222.1 Canon Law 3 cr.**

Canon law is the name given to the rules that govern church order and discipline of the Roman Catholic Church. The goal of this course is to enable students to take a look at the vast field of the canon law of the Catholic Church. This course will allow students to understand some general principles and to learn the methodology of the discipline. This course has been updated to reflect changes and adaptations in canon law and new resources in the field, and offers an introductory orientation of all canon law. This course illustrates the relatively complex domains of canon law, and defines the primary framework and design of the several offices and functions within the church, and shows how they communicate to each other, which will lead to the more important fields of canon law of substance and the context in which more elaborate rules can be implied and

comprehended.

**DRG225 International Public Law 3 cr.**

**Pre-requisites** DRG240.1

This course enables students to learn about the subjects of international law and their legal status; such as, states, organizations, and private persons, and the sources of international law; such as, treaties, customs, general principles, unilateral acts, jurisprudence, etc. The course also discusses the general questions of international law, i.e. questions of law making, sovereignty, jurisdiction, responsibility, enforcement, the settlement of disputes, and specific topics such as the use of force.

**DRG230.1 Introduction to Law 3 cr.**

**Co-requisites** DRG231.1

This course will actively explore all aspects of the law: in se and inter se; public and private; imperative and interpretative; founding principles and theories of law; sources; *ratione loci*, *ratione personæ*, *ratione materiæ*, *ratione temporis*; the Lebanese judicial system.

**DRG231.1 TD Introduction to Law 1 cr.**

**Co-requisites** DRG230.1

Law is a discipline based to a large extent on practice. Therefore, the practical applications, entitled tutorials (*travaux dirigés*), are crucial for a better knowledge and understanding of the course and will raise subjects and issues that might call into question the theory taught in the classroom. Consequently, the tutorials allow students to apply the knowledge learned in the course, and provide a useful complement to the lectures. Tutorials also introduce new information to enable students to delve deeper into the content of the lecture and increase their knowledge and to boost and stimulate their legal research and reasoning skills. Therefore students will have to answer several types of assignments such as legal dissertation, case studies, decision commentaries, etc., that will be corrected by the professor, who will intervene to help students and encourage them to find adequate solutions and to develop their reasoning skills.

**DRG240.1 Political Systems 2 cr.**

**Prerequisites** DRG210.1

This course is designed to present a general overview on the importance of the elections, public powers, and the different political systems adopted by the states in all over the world. This course introduces the idea of the role of public power and the political system adopted within the state.

**DRG245 Consumer Law 2cr.**

**Prerequisites** DRL228.1

The consumer law course aims at studying law n° 659 of February 4th, 2005 related to "the protection of the consumer" which contains sixteen chapters consisting of one hundred and thirty-two articles relating to the protection of the consumer in its different aspects.

**DRG250 Introduction to the Comparative law 2 cr.**

The course offers students an introduction to legal comparison, to its nature and goals in connection with the contemporary globalization processes, with particular reference to the interaction of law and culture in Europe.

Through the first part of this course, students will be exposed to the historical evolution and the main features of the civil law tradition in comparison with the common law tradition. The analysis will touch on some issues that show the convergence of legal systems and traditions favored by the doctrine in the first half of the 20th century and by the European Union in the second.

The second part of this course explores the Italian legal system as example of legal reception and the convergence of legal systems in Europe. After an introduction of the main legal principles and the relevant sources of law, the course deals with different issues related to contract law. Starting from the rules governing Italian law, the selected topic is addressed in a broader European perspective, taking into account the influence of Eu's legislation, as well as the most recent developments in the progressive harmonization and unification of European private law.

**DRG260 Obligations Regime 2 cr.**

**Prerequisites** DRG327

As a continuation of the courses of the Contract law (I and II) and the law of liability, the purpose of the obligation regime is to study the general rules applicable to the relationship between the creditor and the debtor, whatever the source. The study of the general regime is thus added to that of the sources to give a complete view of the law of obligations.

**DRG265 Transitional Justice in Peace Building Processes 3cr.**

**Prerequisites** DRG225

The course-seminar aims to introduce and discuss the concept of transitional justice from conflict transformation perspective with the objective to set the foundations for a positive and durable peace. It will present the pillars or mechanisms of transitional justice that aims to address past human rights violations in post-conflict settings and ways to move forward. It will look at the impact of dealing with the legacy of the violent past on fighting impunity, social cohesion, civil trust, and state building, as well as national reconciliation in times of transition and democratic transformation. The course will focus on institutional reform, reparation, and truth-seeking measures with an emphasis on the right to know the fate of the missing and disappeared persons in post-war Lebanon. The students will be able to analyze problems related to past abuses of human rights in post-conflict societies and will apply what they have learned by organizing and participating in an exercise simulating a truth commission.

**DRG300.1 Special Administrative Law 2 cr.**

**Prerequisites** DRL222.1 Or DRL222.2 Or DRL222

This course is designed to introduce public services and the Lebanese public institutions. It deals with the nature of public administration, as activity and as discipline. Administrative law has two different aspects: enabling and controlling. The course will explore how the law enables government to create institutions and programs to provide public goods and public services, and who oversees and controls the exercise of these powers. Students are expected to develop an understanding and a sense of appreciation of the role of Lebanese public administration, in a historical perspective and in contemporary society. It will also describe the legal regime of public service, the different categories, and the methods of administering public services, as well as the public institutions and their organization. Students are introduced to the role of administrative law in Lebanon from both theoretical and practical points of view. They will explore the rights of those affected and how they can confront abuses of this power, and also whether it is feasible to defy government for failure to exercise the powers given to it.

**DRG311 Regime of Civil Liability 3 cr.**

**Prerequisites** DRG327 Or DRL322 Or DRL322.1 Or DRL322.2

The course will introduce students to civil liability, the private law governing the rights, duties, and obligations that members of society are entitled to and owe to one another. The course will, firstly, draw the distinction between different forms of liabilities, then it will clarify the general framework of civil liability, through a critical assessment of the foundations on which it rests, and highlight the changes that such foundations have gone through.

**DRG320.1 Computer and Internet Law 2 cr.**

| This course studies general provisions regarding the extinction of contracts. It starts with generalities about the effects of contracts and elaborates on the obligatory force of contract as well as its relative value, and then it develops the illicit acts, the illegitimate growth of wealth as well as judicial acts. Then it treats the cancellation of a contract and its dissolution by reason or circumstances subsequent to its formation, which are the rescission of a contract and its termination. Furthermore, it develops the effects of obligations and the remedies available to creditors for the enforcement of performance due to them: right of detention, indirect action, direct action and Paulian action. Finally, it ends with an overview of the transmission of obligations.                                                                                                                                                                                                                       |                                                                            |              |

| Law is a discipline based to a large extent on practice. Therefore, the practical applications entitled tutorials are crucial to a better knowledge and understanding of the course and will raise subjects and matters that might call into question the theory taught in the classroom. Consequently, the tutorials (travaux dirigés), aim to apply the knowledge learned in the course, and provide a useful complement to the lectures. Tutorials intend to introduce new information in order to enable students to delve deeper into the content of the lecture and increase their knowledge and to boost and stimulate their legal research and reasoning. Therefore students will have to answer several types of assignments such as legal dissertation, case studies, decision commentaries, etc., that will be corrected by the professor, who will intervene to help students and push them to find adequate solutions and to develop their reasoning skills.                                                          |                                                                            |              |

| This course aims at introducing and examining the foundations and key principles and rules of the law of war (also known as the law of armed conflict or international humanitarian law, IHL) applicable in times of armed conflict. IHL is comprised of norms designed to humanize and limit the effect of warfare. This course provides students with an overview of the history of IHL, its normative logic and its conditions of applicability as well as an understanding of the main substantive norms. The themes of the course include the sources of IHL, the definition of an armed conflict and the distinction between international armed conflict and non-international armed conflict, the status of persons not taking part or no longer taking part in hostilities, the rules and principles on the conduct of hostilities regulating the means and method of warfare, the means of implementation and enforcement of IHL as well as the interplay between this body of norms and international human rights law. |                                                                            |              |

| The course is intended to provide students with an in-depth understanding of labor laws and social security laws, as well as develop an appreciation for the application of labor laws to the collective labor agreements. The course is designed to give an overview of various aspects of labor relations and social security benefits, including the perspective of working people and their labor organizations. It aims at assisting students in the acquisition of full knowledge and understanding and is intended to stimulate critical reflection on this branch of law.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                            |              |

| This course provides, on the one hand, an understanding of the general theory of fundamental rights and freedoms, with an emphasis on the domestic and international safeguards of fundamental rights, as well as the mechanisms of protection to ensure their observance. The second part analyzes the legal regime of the protected fundamental freedoms, including the right to respect the dignity of a human being, the principle of equality, and civil and political liberties.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                            |              |

| The course studies the rules of law that govern many aspects of business. An understanding of legal rules and constraints provides a framework for understanding the nature, structure and differences between several commercial deeds. It will help students understand the legal meaning of "merchant" and the legal importance of establishing a "business".                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                            |              |
| <b>DRG414.1</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>TD Special Criminal Law</b>                                             | <b>1 cr.</b> |

| Law is a discipline based to a large extent on practice. Therefore, the practical applications entitled tutorials are crucial to a better knowledge and understanding of the course and will raise subjects and matters that might call into question the theory taught in the classroom. Consequently, the tutorials (travaux dirigés), aim to apply the knowledge learned in the course, and provide a useful complement to the lectures. Tutorials intend to introduce new information in order to enable students to delve deeper into the content of the lecture and increase their knowledge and to boost and stimulate their legal research and reasoning. Therefore students will have to answer several types of assignments such as legal dissertation, case studies, decision commentaries, etc., that will be corrected by the professor, who will intervene to help students and push them to find adequate solutions and to develop their reasoning skills.                                                          |                                                                            |              |
| <b>DRG415.1</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>Corporate Law</b>                                                       | <b>3 cr.</b> |

| <b>Co-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | DRG425.1                                                                   |              |

This course is an introduction to the law that governs corporations. It will examine first the rule of contract that governs the formation of corporations in general, and then onto the different types of corporations in a comparative approach between the Lebanese and the French law.

**DRG421.1 TD Commercial law 1 cr.**

**Co-requisites** DRG 411.1

Law is a discipline based to a large extent on practice. Therefore, the practical applications entitled tutorials are crucial to a better knowledge and understanding of the course and will raise subjects and matters that might call into question the theory taught in the classroom. Consequently, the tutorials (travaux dirigés), aim to apply the knowledge learned in the course, and provide a useful complement to the lectures. Tutorials intend to introduce new information in order to enable students to delve deeper into the content of the lecture and increase their knowledge and to boost and stimulate their legal research and reasoning. Therefore students will have to answer several types of assignments such as legal dissertation, case studies, decision commentaries, etc., that will be corrected by the professor, who will intervene to help students and push them to find adequate solutions and to develop their reasoning skills.

**DRG424.1 International Private Law 3 cr.**

**Pre-requisites** DRL228.1

**Co-requisites** DRG 440.1

This course explores one of the most fascinating and complex areas of law: what do you do when legal problems transcend jurisdictional boundaries? What happens when more than one sovereign state (e.g., two countries like Lebanon and France) can apply its laws to a particular situation or transaction? Whose law applies? Whose law should apply? And how should one state treat the laws and judgments of another? The course will draw heavily upon close reading, case analysis, and problem-solving skills.

**DRG425.1 TD Corporate Law 1 cr.**

**Co-requisites** DRG 415.1

Law is a discipline based to a large extent on practice. Therefore, the practical applications, entitled tutorials (travaux dirigés), are crucial for a better knowledge and understanding of the course and will raise subjects and issues that might call into question the theory taught in the classroom. Consequently, the tutorials allow students to apply the knowledge learned in the course, and provide a useful complement to the lectures. Tutorials also introduce new information to enable students to delve deeper into the content of the lecture and increase their knowledge and to boost and stimulate their legal research and reasoning skills. Therefore students will have to answer several types of assignments such as legal dissertation, case studies, decision commentaries, etc., that will be corrected by the professor, who will intervene to help students and encourage them to find adequate solutions and to develop their reasoning skills.

**DRG427 Willem C. Vis Moot I 3 cr.**

« The Annual Willem C. Vis International Commercial Arbitration Moot » is one of the most renowned legal competition around the world with more than 350 universities participating yearly.

The USEK coach applies a specific selection process in which a maximum of 6 students are selected.

The course "Willem C. Vis Moot I" will allow the student to work on the first phase of the competition, being the writing of memorandums for claimant and respondent. This written exercise requires determining questions of contract -- flowing from a transaction relating to the sale or purchase of goods under the United Nations Convention on Contracts for the International Sale of Goods and other uniform international commercial law -- in the context of an arbitration of a dispute under specified arbitration rules.

**DRG428 Willem C. Vis Moot II 2 cr.**

The course "Willem C. Vis Moot II" will allow the student to work on the second phase of the competition, being the hearing of oral argument based upon the memorandums. Their coach will train them on how to present their oral arguments, how to reply to the questions of the jury, how to be team players, how to manage their body language, gestures, stress, etc...

**DRG433.1 International Institutions 2 cr.**

**Pre-requisites** DRG426.1 Or DRG426.2 DRG426 or DRG225

This is a hybrid course combining face-to-face classroom instruction with computer-based learning. It examines the ways in which states and non-state actors organize themselves: intergovernmental, nongovernmental and transnational organizations. It tackles questions relating to the nature of the formal institutions, their legal foundations, structures, functions, activities, and their relevance to global events and issues. A special emphasis will be made on the study of some organizations and agencies in depth, and their relations to the United Nations, which will be given special attention due to the truly global scope of its activities and impact. As the course is presented in a hybrid seminar format, students will be expected to actively participate in the online exercises.

**DRG441.1 TD International Private Law 1 cr.**

**Co-requisites** DRG 424.1

Law is a discipline based to a large extent on practice. Therefore, the practical applications, entitled tutorials (travaux dirigés), are crucial for a better knowledge and understanding of the course and will raise subjects and issues that might call into question the theory taught in the classroom. Consequently, the tutorials allow students to apply the knowledge learned in the course, and provide a useful complement to the lectures. Tutorials also introduce new information to enable students to delve deeper into the content of the lecture and increase their knowledge and to boost and stimulate their legal research and reasoning skills. Therefore students will have to answer several types of assignments such as legal dissertation, case studies, decision commentaries, etc., that will be corrected by the professor, who will intervene to help students and encourage them to find adequate solutions and to develop their reasoning skills.

**DRG450 Land Law and Real Estate Securities 3 cr.**

**Prerequisites** DRL213.1 or DRL 213.2

This course aims to study the general provisions of the real estate securities, its definition, historical development, and divisions. It specifies the principle of the real estate securities' indivisibility, its inscription and radiation. This course develops as well the compulsory delimitation and demarcation, its technical and administrative stage as well as the legal and judicial stage. It also explores the compulsory delimitation and demarcation effects in addition to the optional delimitation and demarcation procedures and effects. It also examines the competence of the land judge, the land register regulations such as the registering system, the procedures of registration and radiation, the types of registrations, the provisional measures and effects and finally the registration effects.

**DRG455.1 Insurance Law 2 cr.**

**Prerequisites** DRL228.1

Insurance law is an integral part of commercial law, the right to the protection of the consumer and the right to compensation for people and their property. This evolutionary law also involves risk and damage prevention, and, by allowing subjects to stipulate conditions, guarantees the respect for precautionary measures and protective measures.

| This course is focused on the third party with the power to settle disputes which may arise between individuals under an arbitration award. Power is generated, in principle, by the agreement of wills of the parties, is the settlement of a dispute by the arbitral dispute mechanism. The course is divided into two parts: the arbitration agreement (Part I), and the requirements of arbitration proceedings that enable the parties to resolve their dispute.(Part II).                                                                                                                                                                                                                                                                                                                   |                                                                           |              |

| This course focuses on shaping public policy by analyzing the limits on law-making authority, identifying options for changing policy, helping to draft policy proposals including model legislation, as well as speaking at a public hearing, conference and seminar in order to advance new policies. The course further offers students a unique opportunity to serve the public by providing pro-bono legal services at a high level of professionalism to low-income individuals (in particular children and women) and families who face difficulty in engaging lawyers for advice.                                                                                                                                                                                                         |                                                                           |              |
| <b>DRG470</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>Moot Court Competition</b>                                             | <b>3 cr.</b> |
| This course prepares the students for the ICC Moot Court Competition which welcomes universities from all over the world for a large scale moot court simulating the proceedings of the International Criminal Court (ICC). The Competition's case addresses fundamental issues of substantive and procedural international criminal law.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                           |              |

| This course gives a general view of the norms governing the service of public agents, be they civil servants or non-permanent staff, whether they serve the state or other public entities. It allows the student to assess the degree of originality of the law of public service in comparison with labor law.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                           |              |

| The course focuses on both the method and methodology of academic research and explains both how and why it is necessary to carry out academic research work. The method / methodology is the focus of this course.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                           |              |
| <b>DRG510</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>Advanced Corporate Law</b>                                             | <b>2 cr.</b> |
| This course examines the following three topics: 1) the main operations that may affect the company as a group; 2) the legal acts that the partners can conclude to perfect the rules of corporate operations; 3) the rules of powers and responsibilities applicable to each corporate player, legal person and corporate organs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                           |              |

| This course is designed to provide students with a comprehensive introduction to bankruptcy law. The key general concepts studied will include: the bankruptcy estate, the different classifications of claims, exemptions, preferences, and fraudulent transfers. In examining the different types of bankruptcy proceedings, we will begin with the rules for liquidations and then explore individual reorganizations. Throughout the course we will explore the policies underlying the bankruptcy law                                                                                                                                                                                                                                                                                        |                                                                           |              |

| This course will review the law of the environment from a theoretical perspective, with an emphasis on international, European and comparative practices. It will increase the student's abilities to grasp a wider knowledge of various documents related to environmental law, such as directives, international conventions, judicial decisions, etc.                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                           |              |
| <b>DRG529.1</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>Introduction to the Common Law</b>                                     | <b>2 cr.</b> |
| This course introduces the common law tradition to students of other legal traditions, in particular the civil law tradition. The focus will be on the case study approach that permeates most of the laws in the common law tradition. It will covers a wide variety of substantive law issues, ranging from contract law, property law, tort law, to criminal law issues. In addition, the course will familiarize the students with common civil law and criminal procedures.                                                                                                                                                                                                                                                                                                                  |                                                                           |              |
| <b>DRG530.1</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>Maritime and Air Law</b>                                               | <b>2 cr.</b> |
| <b>Prerequisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | DRG225                                                                    |              |
| This course provides an overview of the laws governing transportation, customers and users of the means of sea or air transport, as well as intermediaries such as freight forwarders, tour operators, etc. In addition, it takes a thorough look at the responsibility of reviewing legal contracts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                           |              |
| <b>DRG534.1</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>Civil Law: Named Contracts II</b>                                      | <b>3 cr.</b> |
| <b>Co-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | DRG535.1                                                                  |              |
| <b>Prerequisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | DRL412.1 Or DRL412.2 Or DRL412                                            |              |
| This course studies the special rules governing certain contracts, such as the loan and proxy. In its first part, this course studies the general provisions of the lease, which includes the applicable rules to all leases as well as special rules for building leases. It also examines the effects of the lease, which include the obligations of the lessor and the lessee. Finally, it analyzes the extinction of the lease and the land leases. In its second part, this course studies special rules governing the proxy. It starts with a general outline of a proxy, and then determines the effects of proxy between the principal and the agent as well as the effects of the proxy in relation to third parties. Finally, the last part of this course pays particular attention to |                                                                           |              |

the extinction of the proxy.

**DRG535**                    **Bankruptcy and Reorganization**                    **2 cr.**

This course examines the main rules and the philosophy of preventing and addressing business difficulties in French and European law, as compared to the Lebanese law, which takes after an older tradition.

**DRG535.1**                    **TD Civil Law: Named Contracts II**                    **1 cr.**

**Co-requisites**                    DRG534.1

Law is a discipline based to a large extent on practice. Therefore, the practical applications entitled tutorials are crucial to a better knowledge and understanding of the course and will raise subjects and matters that might call into question the theory taught in the classroom. Consequently, the tutorials (travaux dirigés), aim to apply the knowledge learned in the course, and provide a useful complement to the lectures. Tutorials intend to introduce new information in order to enable students to delve deeper into the content of the lecture and increase their knowledge and to boost and stimulate their legal research and reasoning. Therefore students will have to answer several types of assignments such as legal dissertation, case studies, decision commentaries, etc., that will be corrected by the professor, who will intervene to help students and push them to find adequate solutions and to develop their reasoning skills.

**DRG536.1**                    **Family Law II**                    **2 cr.**

**Prerequisites**                    DRG220.1 Or DRG220.2 Or DRG220

This course is offered to students who succeeded in the course 'Family Law I'. They will learn about laws relating to personal status in Lebanon among Christians and Muslims. Starting with a comparison of nullity of marriage, this course considers the courts and the steps to the final judgment. In addition, students learn how to implement provisions to accelerate the procedure of the family law in ecclesiastical courts. Finally, conflicts of jurisdiction between the civil and ecclesiastical courts are taught in this course.

**DRG538.1**                    **Diplomatic and Consular Law**                    **2 cr.**

**Prerequisites**                    DRG225

This course reviews diplomatic and consular laws, in particular the Vienna Convention on Diplomatic Relations of 1961, in the light of state and judicial practices. It will study bilateral diplomatic relations that are maintained by permanent missions, including special missions. The course will also cover diplomatic and consular privileges and immunities.

**DRG540.1**                    **Administrative Litigation**                    **3 cr.**

**Prerequisites**                    DRL222 or DRL222.1 or DRL222.2

Administrative litigation entails some characteristics different from litigation. These differences meet during contentious administrative procedures that involve several phases ranging from introducing the appeal in the judgment itself, and passing by the statement. These are to be applied to the different actions referred to the administrative judge: recourses of full jurisdiction, action for annulment, and action for interpretation. Next to this ordinary procedure exist emergency procedures allowing litigants to obtain a rapid decision from the judge.

**DRG541.1**                    **Constitutional Litigation**                    **3 cr.**

**Prerequisites**                    DRG210.1

This course is designed to present a general overview of the jurisdiction of the Constitutional Council in France Lebanon, and the importance of the constitutionality control of law, as well as the electoral litigations.

This course also introduces the prominence of specific rights and freedoms that must always be respected in each society.

**DRG545**                    **Law and Business of Corporate Transaction**                    **2 cr.**

This course provides a comparative approach to contract law, including intermediary contracts, commercial agencies, mandates, commissions, and brokerage under French and Lebanese law.

**DRG550.1**                    **Methods of Enforcing Judgments**                    **3 cr.**

**Prerequisites**                    DRL321.1 Or DRL321.2 Or DRL321 or DRL325.1 or DRL325.2

This course introduces the measures of enforcement, and the general provision of the measures of enforcement. Then it determines the competence of the enforcement court, including the subject matter competence, the competence by reason of the person concerned and the venue jurisdiction. Then it elaborates on the writ of enforcement, including executive power, object of the enforcement and the parties. Next, it determines the procedures before the enforcement judge and the decision of the latter. In addition, this course allows students to assimilate the plea to stay as well as the opposition. It develops also the sequestration of property, the garnishment, the enforcement by sale of the debtor's real property, the tender specifications and the sale by auction by order of the court. Finally it ends with a study on the seizure of movable goods for sale and imprisonment for debts.

**DRG555**                    **Criminal Business Law**                    **2 cr.**

This course provides an overview of the criminal offenses applicable to the business and corporate world: 1) common law offenses also applicable to enterprises, especially fraud, breach of trust, and money laundering; 2) specific business offenses, including the misappropriation of corporate assets, and bankruptcy.

**DRG560**                    **Finance and Financial Market Law**                    **2 cr.**

**Pre-requisite**                    DRG415.1

This course, which is an extension of the corporate law course, takes a practical look at modern notions of capital and financial investment. Today, corporate companies have become real players in finance and financial markets. Thus, the bonds of these companies and their deriving products such as GDRs, voting certificates and various options, etc., are now the subject of various transactions on the financial markets, both regulated and unregulated. In addition, new corporate structures have been especially dedicated to financial investment, outside the scope of markets, such as SICAPs provided for in the Lebanese law. The purpose of the course is to introduce our students to the realities of our current world in terms of finance and investment. The teaching perspective will take, as a starting point, the corporate law course in order to study the corporate companies as actors in the financial market and as authors of their own financing. The course will be structured around four axes: Actors of financial law - structures of financial law - acts of financial law - the legal securing securitization in financial law.

**DRG589.1**                    **Intellectual and Artistic Property**                    **2 cr.**

**Prerequisites**                    DRL213.1

This course introduces students to the principles and concepts of the Lebanese intellectual property law, including its two main categories: literature and artistic property and the industrial property (mostly patents). The course also focuses on the international aspects of branches of intellectual property and the patent laws.

**DRG590A**                    **Research Dissertation**                    **6 cr.**

The student prepares a research paper under the direction of a Master's teacher and defends it before a jury composed of three teachers, at least two of whom are part of the Master's teaching team. The third member may be a USEK teacher and doctor of law.

| <b>DRG610</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>Civil Law</b>                                | <b>3 cr.</b> |
| The course is designed to present a depth of knowledge on the basics of contracts and their typology, and to develop the negotiation period and study the liability of the parties in case of breach of contract. Moreover, this course allows students to assimilate the characteristics of the consumption contract, the franchise agreement, leasing, the electronic contract and, finally, the information technology contract.                                                                                                                                                                                                                                                                         |                                                 |              |
| <b>DRG611</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>Business Law</b>                             | <b>3 cr.</b> |
| This is an advanced corporate law course designed specifically for Master students. The course will discuss aspects of economic and legal policy of various issues in business law as well as their practical implications. It is designed to provide law students with the analytical tools necessary to understand the financial and economic factors that underlie business structures in corporate law.                                                                                                                                                                                                                                                                                                 |                                                 |              |
| <b>DRG612</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>Criminal Law and Criminal Procedure</b>      | <b>3 cr.</b> |
| This course covers highly discussed topics in criminal law and criminal procedure, such as the principle of criminal legality, the application of criminal law <i>ratione temporis</i> , <i>actus reus</i> and <i>mens rea</i> , criminal responsibility and irresponsibility, impartiality of the judge in criminal proceedings, public action and civil action, criminal evidence, secrecy of criminal proceedings, rights of the defense, etc.                                                                                                                                                                                                                                                           |                                                 |              |
| <b>DRG615</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>Judicial Institutions</b>                    | <b>3 cr.</b> |
| The course of Judicial Institutions has an introduction and two parts.<br>The introduction covers the concepts, the history and the sources of our judicial institutions.<br>Because procedural rules can be critical elements of litigation strategy and case success, one of the two major segments of this course will be devoted to overview of the entire body of rules of civil procedure ranging from commencement of proceedings, to defining issues for trial, to enforcement of judgments. The second major element of this course (and the one we will tackle first) is an area called jurisdiction. In this segment we will explore the constitutional and statutory sources of judicial power. |                                                 |              |
| <b>DRG620</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>Administrative Law</b>                       | <b>3 cr.</b> |
| The administration is subject to a law which regulates its activity and, thereby, its relationship with citizens. This course explains the unilateral administrative act, administrative contracts, various appeals and the liability of the public authority.                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                 |              |
| <b>DRG621</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>Constitutional Law</b>                       | <b>3 cr.</b> |
| The course presents the concepts of constitutional law based on two main ideas: authority and freedom. This vision is founded according to the bodies constituting the public powers, their functions and their relationships between each other and the governed population.                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                 |              |
| <b>DRG622</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>International Public Law</b>                 | <b>3 cr.</b> |
| This course enables students to learn about the subjects of international law and their legal status; such as, states, organizations, and private persons, and the sources of international law; such as, treaties, customs, general principles, unilateral acts, jurisprudence, etc. The course also discusses the general questions of international law, i.e. questions of law making, sovereignty, jurisdiction, responsibility, enforcement, the settlement of disputes, and specific topics such as the use of force.                                                                                                                                                                                 |                                                 |              |
| <b>DRG623</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>Tax Law and Public Finances</b>              | <b>3 cr.</b> |
| This course explains the fundamental concepts relating to the budget of the State, its preparation, enforcement and control. On the other hand, the general theory of tax requires the study of the notion of tax, classification of taxes, tax techniques, and tax administration. Then it focuses on the three main taxes: tax on income, VAT, and the estate tax.                                                                                                                                                                                                                                                                                                                                        |                                                 |              |
| <b>DRG625</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>International Contract Law</b>               | <b>2 cr.</b> |
| This course examines several transversal topics, such as the conflicts of laws and jurisdictions, arbitration, and the United Nations' Vienna Convention on Contracts for the International Sale of Goods.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                 |              |

| The student completes an internship in a company or law firm for a minimum period of two months, in Lebanon or abroad. Following the internship, the student drafts an internship report and defends it before a jury composed of three members, at least two of whom are teaching personnel on the Graduate Studies level. The third member may be a USEK teacher and doctor of law, or the student's internship supervisor.                                                                                                                                                                                                                                                                               |                                                 |              |
| <b>DRG665</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>Contractual Technique</b>                    | <b>2 cr.</b> |
| This course adopts a practical approach to contract law, by examining the general structure of a contract and its principal provisions, and includes the analysis and drafting of clauses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                 |              |

| This course starts with a general comparison between objective and subjective rights. It then develops extrapatrimonial rights and a study regarding the estate, including its composition, characteristics and the position of the Lebanese law. It then deals with the patrimonial rights, including definition, sources, characteristics and its extinguish reasons. The course then develops the distinction between personal rights and property rights as well as the intellectual rights and the classification of properties: tangible and intangible assets. Finally this course ends with a study on the tangible real properties, the fixtures and the real actions.                                                                                                                                                                                                                                                                                                    |                                                                      |              |

| Law is a discipline based to a large extent on practice. Therefore, the practical applications entitled tutorials are crucial to a better knowledge and understanding of the course and will raise subjects and matters that might call into question the theory taught in the classroom. Consequently, the tutorials ( <i>travaux dirigés</i> ), aim to apply the knowledge learned in the course, and provide a useful complement to the lectures. Tutorials intend to introduce new information in order to enable students to delve deeper into the content of the lecture and increase their knowledge and to boost and stimulate their legal research and reasoning. Therefore students will have to answer several types of assignments such as legal dissertation, case studies, decision commentaries, etc., that will be corrected by the professor, who will intervene to help students and push them to find adequate solutions and to develop their reasoning skills. |                                                                      |              |

| Law is a discipline based to a large extent on practice. Therefore, the practical applications entitled tutorials are crucial to a better knowledge and understanding of the course and will raise subjects and matters that might call into question the theory taught in the classroom. Consequently, the tutorials ( <i>travaux dirigés</i> ), aim to apply the knowledge learned in the course, and provide a useful complement to the lectures. Tutorials intend to introduce new information in order to enable students to delve deeper into the content of the lecture and increase their knowledge and to boost and stimulate their legal research and reasoning. Therefore students will have to answer several types of assignments such as legal dissertation, case studies, decision commentaries, etc., that will be corrected by the professor, who will intervene to help students and push them to find adequate solutions and to develop their reasoning skills. |                                                                      |              |

| This course studies the general theory of contracts. It starts with generalities regarding contracts, and then it develops the constituent elements or conditions of validity of the contracts, including consent, sollicitation, acceptance, the object, the cause and common provisions to the vitiation of consent. It will then elaborate on the vitiation of consent, including error, fraud, fear, tort, and incapacity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                      |              |

| Law is a discipline based to a large extent on practice. Therefore, the practical applications entitled tutorials are crucial to a better knowledge and understanding of the course and will raise subjects and matters that might call into question the theory taught in the classroom. Consequently, the tutorials ( <i>travaux dirigés</i> ), aim to apply the knowledge learned in the course, and provide a useful complement to the lectures. Tutorials intend to introduce new information in order to enable students to delve deeper into the content of the lecture and increase their knowledge and to boost and stimulate their legal research and reasoning. Therefore students will have to answer several types of assignments such as legal dissertation, case studies, decision commentaries, etc., that will be corrected by the professor, who will intervene to help students and push them to find adequate solutions and to develop their reasoning skills. |                                                                      |              |

| This course about civil procedure (part I) is designed to present a general overview of the basics of civil procedure. Therefore, it begins by presenting the general provisions related to the case, such as conditions of admissibility, the right and capacity to sue. It then introduces the plea of unacceptability and the plea in bar as well as the classification of actions and the estimation of the amount of the dispute. It also determines the judicial organization and the theory of competence. In addition, this course allows students to assimilate the provisions related to proof, including notarial act and simple contract, instrument in writing and plea of forgery, avowal, personal appearance, path and promissory oath, testimony evidence and finally presumption and authority of the adjudged matter.                                                                                                                                           |                                                                      |              |

| This course about civil procedure (part II) starts by developing representation before a court, the writ of summons, the delays, the legal judicial aid and the procedure before the court of first instance. Then it introduces the incidental plea, the theory of judgments and the special hearing in civil matters. In its second part, this course develops decision-making in a non-contentious matter, correction and interpretation of judgments and the several remedies of law, including the opposition, the appeal, third party opposition, retrial and cassation.                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                      |              |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                  |              |

| This course studies the special rules governing certain contracts, such as the sale agreement and the barter system. It is designed to present some provisions about sales, like the conditions for a sale, who may buy or sell, things, what may be sold, the price and the perfect sale. It also treats the effects of the sale and develops in details the vendor's obligations and the buyer's obligations, as well as some special kinds of sale. Moreover, it gives an idea about the promise to sell and promise to buy. Finally, this course develops the barter agreement in its general and specific provisions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                  |              |

| Law is a discipline based to a large extent on practice. Therefore, the practical applications entitled tutorials are crucial to a better knowledge and understanding of the course and will raise subjects and matters that might call into question the theory taught in the classroom. Consequently, the tutorials ( <i>travaux dirigés</i> ), aim to apply the knowledge learned in the course, and provide a useful complement to the lectures. Tutorials intend to introduce new information in order to enable students to delve deeper into the content of the lecture and increase their knowledge and to boost and stimulate their legal research and reasoning. Therefore students will have to answer several types of assignments such as legal dissertation, case studies, decision commentaries, etc., that will be corrected by the professor, who will intervene to help students and push them to find adequate solutions and to develop their reasoning skills.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                  |              |

| <b>Prerequisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | DRG300.1                                         |              |
| This course consists of two parts: the budgetary law and the tax law. It explains fundamental concepts relating to the budget of the State, its preparation, enforcement and control. On the other hand, the general theory of tax requires the study of the notion of tax, classification of taxes, tax techniques, and tax administration. Then it focuses on the three main taxes: tax on income, VAT, and the estate tax.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                  |              |
| <b>DRL510.1</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>Civil law: Personal Status</b>                | <b>3 cr.</b> |
| This course is aimed at studying the non-Muslim will, its conditions of validity, the characteristics of bequests, the testator's intent, consent, the capacity, the object, the cause and the interpretation of wills. It then elaborates the types of succession bestowed by a will, its forms and the appointment of devisee and legatee, the disposable portion of an estate as well as the revocation of a will and forfeiture and inheritance for non-Muslims, including: means of estate devolution, the opening of the succession, the entitlement to the inheritance, the estate distribution to the heirs, the participation per stripes and the devolution of an estate. Finally, in its last part, this course develops the Muslim will and the Islamic inheritance, the obligatory shares and the agnates, and lastly the restoration of property to a succession, the default of heirs and the case of a missing person.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                  |              |

| <b>Prerequisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | DRL310.1 or DRL310.2                             |              |
| This course covers the part of the criminal procedure that relates to criminal proceedings and criminal investigation. With regard to criminal proceedings, the course will study (a) Public Action: initiation; restrictions that apply to it; grounds for its extinction; such as, death of defendant, amnesty, expiry of the prescription period, and (b) Civil Action: relation to public action, civil parties, nature of damage, competent authorities to hear a civil case). The criminal investigation part of the course will closely follow the path of public action from the stage of (a) Preliminary Inquiry, as conducted by the judicial police force, up to the stage of (b) Investigation, as examined by the investigating judge and determined by the Indictment Division.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                  |              |
| <b>ICL500</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>Introduction to the American Legal System</b> | <b>3 cr.</b> |
| This course introduces LL.M. students to the judicial function in a tripartite government (judicial independence and judicial review of legislative and executive authority), the structure of the American judicial systems (organization and functions of trial and appellate courts), the role of the federal courts in the federal system (subject matter jurisdiction and allocation of power), the meaning and use of judicial precedent, and the work of lawyers in an adversary system. This is a required course in the first semester of enrollment for all students in the ALFL track. Please note: this course is not available to J.D. students. .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                  |              |
| <b>ICL650</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>Contract Law</b>                              | <b>2 cr.</b> |
| This course introduces students to the sources of basic principles of contract law in the United States. The course will study contract formation, performance, breach, and available remedies under the common law, with references to parallel provisions in Article 2 of the Uniform Commercial Code.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                  |              |
| <b>ICL655</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>Legal Writing</b>                             | <b>1 cr.</b> |
| This course introduces the International LL. M. students to the basic tenets of the American legal system, writing styles, and basic research, and an overview of the law of contracts. This course is also designed to simulate an environment that a typical American practitioner commonly encounters in early law firm practice within the American system, but will also prove instructional and valuable to any student, regardless of career goals. Its ultimate goal is to ensure that participants become competent and confident in their ability to meet the demands of practice throughout their careers, within the American legal system, as legal researchers and writers. LL. M students will work on a series of research and writing assignments which closely simulate those typically given to associates or law clerks by law firms or judges within United States jurisdictions. The course also focuses on reinforcing skills proficiency through research instruction in general, as well as intensive assignment-specific writing instruction, guidance, feedback, and individual mentoring. Ultimately, the course is designed to give students as much practical training as possible to confidently master the ability to independently research, analyze, organize, and write legal memoranda and briefs on a variety of topics in both objective and persuasive writing. The course also provides a brief survey of American contract law, and may also include an essay-style examination on that subject at the end of the course. |                                                  |              |

| Every student is required to write a substantial research paper under faculty supervision. This requirement, which must be satisfied prior to graduation and after completion of the basic-level required courses, can be met in several ways: in connection with courses, seminars, law review, or independently.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                  |              |

| This course examines the rights and duties of financially distressed debtors and their creditors under the Bankruptcy Code and related state laws. Topics include fraudulent transfers, property exemptions, automatic stay, the powers of a bankruptcy trustee, relative priorities among secured and unsecured creditors, liquidation vs. debtor rehabilitation, and the social and economic implications of debt forgiveness.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                  |              |
| <b>ICL520</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>Closely Held Business Organizations</b>       | <b>3 cr.</b> |
| This course considers the formation, management, and control of partnerships and closely held corporations, including distribution of powers within                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                  |              |

such organizations and application to them of agency and fiduciary principles.

**ICL525 Comparative Competition Law 3 cr.**

After introducing the economic rationale for antitrust or competition law and enforcement, this course analyses the rules and their interpretation in the U.S. and E.U. with regard to the three major pillars of antitrust law: cartels/collusion, abuse of dominant position/monopolization, and merger control. Some discussion of the laws of other countries will be added for illustrative purposes or in response to student interest. Prerequisites: None.

**ICL530 European Union Law: Doing Business in and with the Internal Market 3 cr.**

This course is divided into three parts. The first part introduces the pros and cons of economic integration and the specific European model of market integration. The second part provides detailed analysis of the free movement of goods, employed people, services, capital, and the freedom of establishment in the internal market. The third part examines specific rules for U.S. and other third country businesses, in particular the customs and trade law of the EU.

**ICL535 European Union Law: Foundations 3 cr.**

This course analyzes the legal system of the European Union and its interaction with Member State law and policy in detail. There will be an emphasis on decision making, supremacy, direct effect, breaches of European law, legal remedies, the protection of human rights and procedural guarantees, as well as the challenges of widening, deepening, and enlarging the European Union.

**ICL540 International Business Transactions 3 cr.**

This course analyzes the most common issues related to international sales and other business transactions, in particular the choice of law, drafting of the main contract, methods of financing problems related to shipping, passing of property and risk, insurance, as well as related issues, such as licensing and technology transfer.

**ICL545 International Commercial Arbitration 3 cr.**

This course provides a thorough introduction to this modern method of choice for disputes arising from international commercial transactions, including the specifics of the arbitration agreement, selection of arbitrators, presentation of cases, and the effect, limits, and enforcement of arbitration awards.

**ICL550 International Criminal Law 3 cr.**

This course covers the application of domestic and international law, questions of jurisdiction over international criminal activities, granting of amnesty to persons responsible for international crimes, international cooperation in criminal matters, substantive international law as contained in multilateral treaties concerning war crimes and terrorism, and the permanent International Criminal Court.

**ICL555 International Environmental Law 3 cr.**

This course examines how international law and legal institutions are responding to transboundary and global environmental challenges. Students review prominent issues such as climate change, water scarcity, deforestation, biodiversity loss, ozone depletion, mineral extraction, and marine resource threats, in the context of international development and transboundary trade. Students then analyze selected issues in depth, looking at the science and law of specific environmental challenges as well as the political, economic, and cultural context within which solutions must be formulated.

**ICL560 International Human Rights Law 3 cr.**

This course considers selected problems in international human rights law, including problems related to U.S. law and practice. The course focuses on the growing role of human rights in international relations, emphasizing the United Nations system for the promotion and protection of human rights as well as the regional systems in Africa, the Americas, and Europe.

**ICL565 International Law 3 cr.**

This course introduces basic concepts and principles such as sources of public international law, the law of treaties and international agreements, states and recognition, state liability and human rights, and jurisdiction and immunities from jurisdiction. The course also covers act of state doctrine, Law of the Sea, and resolution of transnational disputes through national and international courts, arbitration tribunals, the United Nations, and diplomatic exchanges. Course topics include terrorism and hostage-taking, U.S. executive-legislative conflict in the conduct of foreign relations, suits by and against foreign states, worldwide improvement of civil and political rights, extraction of seabed resources, and prohibition of the use of force in international relations.

**ICL570 International Tax 3 cr.**

This course introduces the fundamental U.S. income tax issues arising when (1) U.S. persons or entities earn income outside of the U.S. or (2) foreign persons or entities earn income inside the U.S. Depending upon the number of credit hours, specific topics may include the rules for classifying income as U.S. or foreign-source income, transfer pricing, income deferral and controlled corporations, double taxation and the foreign tax credit, foreign currency transactions, and the role of tax treaties. Although the course will not study non-U.S. tax systems in detail, it will highlight significant differences between the U.S. approach to cross-border transactions and those adopted by other taxing authorities.

**ICL575 International Trade Law 3 cr.**

This course addresses theory and practice of international business law issues likely to be encountered by attorneys representing clients engaged in international operations. Topics include foreign investment by U.S. companies, foreign investment in the U.S., international joint ventures, licenses, exporting of goods, international marketing, U.S. trade controls, customs, antidumping, and international antitrust.

**ICL580 International Intellectual Property 3 cr.**

This course examines the international context of the development of copyright, patent, and trademark law, with an emphasis on multinational treaties, developments in the European Union and other jurisdictions, and enforcement of international claims.

**ICL585 Internet Law 3 cr.**

This course examines a wide variety of legal and policy issues raised by the internet, involving many areas of law. The questions addressed may include issues of copyright, trademark, defamation, the Communications Decency Act, cybercrime, contracts, privacy and personal jurisdiction.

**ICL590 Sem. Intl. Legal Transactions 3 cr.**

Selected problems in international law and international legal transactions are addressed in this course. The focus is on issues representing a convergence of public and private international law, with critical analysis of international law principles and practice. This is a problem-solving course, in which students are expected to participate actively. Problems covered in this course comprise of a range of private and public international law topics, including international trade, treaty compliance, the United Nations system, environmental concerns, use of force, international investment, and mechanisms for dispute settlement.

**ICL595 Oil & Gas Law 3 cr.**

This course examines the law associated with oil and gas as well as the rights and responsibilities of relevant parties throughout the production process, including the origin and production of oil, gas and minerals; the nature and protection of interests in oil and gas; the oil and gas lease and important provisions; covenants implied in oil and gas leases; title and conveyance problems (transfers by fee owners and lessors); and pooling and

unitization agreements.

| This course addresses state and federal laws governing the offering and distribution of securities to the public by corporate issuers and others, regulation of securities markets, and the rights and liabilities of purchasers and sellers of securities under such statutes. The course emphasizes statutes administered by the Securities and Exchange Commission.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                              |              |

| This course begins with analysis of why nations trade and the effects of free trade vs. protectionism, typical import and export rules and procedures, and various forms of trade barriers. The main focus is on establishment of GATT and WTO rules and their impact on modern trade in goods and services. The course finishes with an outlook on twenty-first century hot spots in international trade, such as intellectual property rights, environmental protection, human rights and labor standards, and the perspectives of developing countries.                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                              |              |
| <b>MES600</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>Regional Dynamics and Current Issues in the Middle East</b>                               | <b>3 cr.</b> |
| This seminar course is intended to provide an analysis of the regional system and the international relations of the Middle East. We will examine the genealogy and the main features of the regional system: level of analysis, regional security complex, the revival of subnational and transnational ideologies, the emergence of the role of non-state actors in regional politics and conflict situations, the geopolitical dynamics of the Arab Spring, the increasing role and weight of non-Arab regional powers (Turkey, Iran, etc.), the new patterns of competition between major powers (Russia, U.S., etc.), and the geo-sectarian competition between Iran and Saudi Arabia. In the second part, the course will cover specific regional challenges like the refugees, food security and water scarcity and energy security in the Middle East. The course will finalize with an assessment concerning the future perspectives for Lebanon within the geopolitics of the Middle East. |                                                                                              |              |
| <b>MES605</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>The Middle East and Europe: Issues and Challenges in the Tran-Mediterranean Relations</b> | <b>3 cr.</b> |
| The course is intended to provide an analysis of the evolution of the complex relations of interdependence between the Middle East and Europe. It focuses particularly on the development of the multilateral structures of cooperation between the two regions such as the Euro Arab Dialogue, the Euro Mediterranean Partnership known as the Barcelona Process, and the Union For the Mediterranean plus other smaller structures of cooperation. The course addresses the context, the factors, and the constraints that shaped the creation and the functioning of these different structures of cooperation. The course addresses also the different challenges facing the Middle East and Europe since the coming of the "Arab Spring" and the implications of these challenges for the Trans Mediterranean relations in the political security economic and cultural fields.                                                                                                                 |                                                                                              |              |

| The course offers an insight into the key economic and developmental challenges facing the states in the region and their political and other repercussions on the Middle Eastern societies. It offers a perspective on the different obstacles facing the many proposals for Economic integration in the region.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                              |              |
| <b>MES680A</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>Master Thesis</b>                                                                         | <b>6 cr.</b> |
| The student prepares a research paper under the direction of a Master's teacher and defends it before a jury composed of three teachers, at least two of whom are part of the Master's teaching team.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                              |              |
| <b>POL211</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>Introduction to Political Science</b>                                                     | <b>3 cr.</b> |
| <b>Pre-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | LFR120                                                                                       |              |
| This course provides a comprehension of the essential principles of political science study. It introduces students to the discipline's greatest thinkers and their philosophies. This course emphasizes on the changing nature of power, legitimacy, governance, political behavior and institutions. It tackles                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                              |              |

the discipline's most important theories and methods.

**POL212 Introduction to Geopolitics 3 cr.**

**Pre-requisites** LFR120

The analysis of how political decisions are conditioned by geographical settings is the subject matter of geopolitics. In purely spatial terms, geopolitics is the study of boundaries and areas. In conceptual terms, geopolitics comprises the study of international relations and the outcome of power struggles, at local and global scales. It explores events such as the emergence of new states, the fragmentation of countries, and regional conflicts affecting several countries. The main objective of this course is to give you a broad introduction to geopolitics, and to the special role that geopolitical events play in asset prices; it also aims to provide you with tools to make better practical use of general geopolitical awareness and with frameworks to think through the "breaking news" (news that conventional macroeconomics treats as "exogenous events"). The course has two parts. Part one introduces key ideas in geopolitics and provides basic tools to analyze geopolitical events. These tools are largely drawn from the world of elementary political and intelligence analysis. As you will discover (repeatedly) in class, to analyze is not always to quantify (and vice versa). In the most practical way, Part one will help you "think about thinking" and teach you to avoid common errors in reacting to geopolitical, news, events, and trends. Part two then offers you a chance to practice the styles of thinking and tools acquired in Part one.

**POL213 Introduction to International Relations 3 cr.**

**Pre-requisites** LFR120

Beyond any theoretical perspective, this course presents the current state of international relations following the fall of communism; emphasizing the new world order, globalization, the role of the United States and its reappraisal.

**POL215 Introduction to Public Administration 3 cr.**

This course is designed to introduce broadly the Lebanese Public Institutions. It deals with the nature of public administration, as an actor and as discipline. Public administration has two different aspects: enabling and controlling. The course will explore how the law enables government to create institutions and programs to provide public goods and public services, and who oversees and controls the exercise of these powers. Among the topics covered are major theories of management, the policy process, and the relationship between politics and administration. Upon completion of the course, students will have a general understanding of the history and practice of public administration. Students will also learn basic concepts from the fields of public budgeting, human resources, and strategic management.

**POL224 Political Science Method 3 cr.**

This course trains students on two levels: linguistic and reflexive. Its objective is to prepare students for the rigorous study in the Bachelor program. It aims to assist students in learning the working methods of political science. Several methodological tools will be taught for this purpose: linguistically, analysis and summaries of texts adapted to different areas of political science, lecture notes, presentations and oral argument, and on the reflexive level, mastery of techniques of dissertation writing, so students can learn to differentiate between personal thinking and personal opinion, engage in synthetic reflection, and present a mini-dissertation "research" applying the methods learned throughout the semester. This course is meant to be participative and students are advised to take this course at the beginning of their degree program.

**POL226 Political Economy 3 cr.**

This course aims at introducing students to the different theories of political economy and the study of the political economy of states around the world. Students will learn about the relationship of globalization and international political economy, and how it affects the political economy of states. In addition, there will be discussion of different regional economic integration around the world. The course also will introduce students to the relationship between large aggregates: GDP, consumption, unemployment, gross fixed capital formation, export, import to one another and to the welfare system of the state.

**POL321 Modern and Contemporary Political History 3 cr.**

The course focuses on the political, economic and sociological landscape covering the major issues of the twentieth century: the world wars, colonization, the East-West confrontation, the Cold War, decolonization, the disintegration of the USSR, the fall of the Berlin Wall, the European integration, US hegemony, the new international order resulting from the Gulf War, etc.

This course focuses on the major constituent events in the modern and contemporary political history of the Middle East. It highlights fundamental aspects of the emergence and evolution of this region: the fall of the Ottoman Empire and its impact, Franco-British colonization, independences and confrontation with the State of Israel, etc.

**POL331 European Union: History, Organization and Political Challenges 3 cr.**

This course is designed to introduce students to the multiple European realities and challenges faced by the European Union (EU). All the political risk factors obliged us to reconsider what EU represents as a model of regional integration and as an important player of the international politics. Throughout the first part of this course, we will provide students with the analytical tools and intellectual frameworks needed to understand the historical development registered by this sui generis actor of the current international relations. Likewise, the course tackles the link on the one hand, between multilateralism and multilateral diplomacy, and on the other, between regionalism and the impact of regional integration. In the second part, this course presents the complex organization of the EU. The course aims to explain the role displayed by its main institutions (European Council, Council of the European Union, European Commission, European Parliament, etc.) in order to prove whether these institutions are being effective concerning the main political challenges facing the EU. In the last part, this course analyzes the main political challenges that EU is actually facing from three different perspectives: historical, theoretical, and empirical. Among them, the course points out BREXIT, international terrorism, ultra-Nationalism, Euro-skeptic movements, refugee challenges, lack of solidarity, energy dependence, and other security threats like the revival of the Russian impetus.

**POL334 Political Regimes of Arab Countries 3 cr.**

This course provides an understanding on the nature of Arab countries, their contemporary history, political systems and their key ideological foundations. It offers a comparative approach to the different systematic foundations that exist in states of the Arab World.

**POL335 Politics and Mass Media 3 cr.**

Political power remains voiceless or even nonexistent if it does not communicate with the masses, and it is put in danger if it communicates poorly. At its worst it can become autocratic, communicating one way. This course is responding to the question of how to call upon mass communication without manipulating which, this is the policy issue in democracy and the main focus of this course.

**POL336 History of Political Thought 3 cr.**

This course covers the history of political thought, from ancient times to contemporary history. Particular attention is paid to concepts such of democracy, citizenship, the birth of the states, revolutionary movements, liberalism, socialism and conservatism.

**POL340 Internship and simulation 3 cr.**

This course introduces students to the conduct of political training and research using simulation technique, game theory methods and internship in appropriate institutions submitting report at its accomplishment. This will be done in the context of specific political and IR research activities like

public opinion surveys, voting behavior, decision making systems, comparisons of political processes in different countries, and the evaluation of public policies making. Students participate in joint class projects and conduct individual projects. This course will be divided into two parts: internship and simulation.

**POL345 Theories and History of the State 3 cr.**

The main goal of this course is to provide students with the necessary analytical tools to understand the relevance of the State as a political institution. The first part of the course will be focused on the theoretical approaches to understanding how important is the State for the political game (Hans Kelsen, Hermann Heller, and Carl Schmitt). The second part of this course will be addressed to the presentation and explanation of the evolution registered by the State, Constitution, and Declaration of Rights. Finally, the course will present the political game between Government and Parliament to understand how these two can affect the political process and policies.

**POL505 Political Theories, Methodology and Political Science Challenges 3 cr.**

This course is devoted to issues of political science research, from theoretical and methodological points of view, and it proposes to revisit the major themes that characterize the discipline. What are the main research areas favored by political scientists today? What are the theoretical implications? What impact can political science research have on the societies studied?

**POL510 Comparative Political Systems 3 cr.**

The comparative study of contemporary systems is a relatively recent development in the field of political systems and this course focuses on the comparative analysis of different Western political systems in particular. There will be an emphasis on the practice of comparing systems, comparing and classifying what is studied in order to achieve a generalization or a developing a better explanation. Political science is no exception to the rule and comparative work makes up a significant part of the analysis conducted on the diversity of socio-political phenomena around which the discipline is built. The methodological approach of this course will combine comparative analysis by subject and then by country. Throughout this course students will be invited to participate in an active way.

**POL515 Challenges of Globalization 3 cr.**

This course provides a multidisciplinary approach to the challenges of globalization, with a particular emphasis placed on its scope and its economic consequences. We will discuss the much debated theoretical questions about globalization, and combine it with an analysis of changes in the balance between powers in the 20<sup>th</sup> and 21<sup>st</sup> centuries, including the decline of traditional powers, the emergence of new regional powers, the multiplication of decision centers, and the role of international governance in organizations.

**POL520 Current issues in the World order 3 cr.**

This course is a set of practical activities focused on current issues. Presentations and press releases, the writing of book reviews and synthesis, and participation in simulation debates are all exercises that will allow students to gain practical and working methods in close contact with the current themes of international, regional and national politics.

**RIN210 Introduction to Comparative Politics 3 cr.**

This course is designated to introduce the subfield of comparative politics. It is intended to offer a comparative understanding. In the first part, the course will explain the link between comparative politics and political science providing students with an explanation of the main theoretical approaches of comparative politics and the main comparative research methods. In the second part, the course will address the typologies of political regimes and political systems to properly differentiate democratic from authoritarian and totalitarian regimes. Likewise, we will explain the process of political change. In the last part of this course, we will compare political systems and process through some case studies (Syria, Tunisia, U.S., Russia, China, etc.) in order to link theory with real cases.

**RIN431 Diplomatic and Consular Law 3 cr.**

This course is about the organization of diplomatic and consular posts, and the immunities and privileges attached to it according to the Vienna Conventions.

**RIN441 Existing and Emerging World Powers 3 cr.**

This course covers the political and economic issues of world powers: the United States, France, Britain, Germany, and Russia. It also addresses the emerging world powers: China, India, Brazil, and South Africa.

**RIN442 Transnational Movements 3 cr.**

This course deals with movements that do not position themselves necessarily under the traditional influence of the states, whether NGOs, lobbies, or Diasporas, all of which seem to obey their own logic. This class mainly attempts to explain their recent development, especially through international social movements, in the field of environmental protection and the phenomenon of globalization.

**RIN443 The Arab-Israeli Conflict 3 cr.**

This course considers the history of the Arab-Israeli conflict since the founding of the State of Israel and its impact on the regional and international political map, including: the interference of international powers in this conflict, the political contexts of the wars of 1956, 1967, 1973, 1982, and the process of peace (the peace conference in Madrid, the Oslo Accords, and the peace treaty between Israel and Jordan), the problem of the Golan Heights and the Shebaa Farms.

**RIN444 Water and Energy Issues in Regional Politics 3 cr.**

This course considers the issue of waters and rivers in Turkey and in the Middle East, as well as the issue of energy in the region, international and interstate conventions and agreements concerning water, strategies and regional water conflicts, large water projects established and executed in the region, the water needs of states and water projects in Lebanon.

**RIN451 Theories of International Relations 3 cr.**

The course is designated to familiarize students with the main schools of thought within International Relations, the history of how the discipline has evolved, and the plurality of the theoretical proposals of the discipline. It will also serve to point out new paths and debates that have been opening up in recent decades within this area of social sciences to understand the international world. The approach to the plurality of theoretical proposals that coexist today in the discipline will serve at the same time for students to learn to analyze and reflect on problems, conflicts, international events of the world contemporary such as globalization, state, sovereignty, armed conflicts, nuclear weapons, human rights, war and peace, use of force, terrorism international, etc.

**RIN452 Regional and International Organizations 3 cr.**

Regional and International Organizations is designed to introduce you to the scope of the field and the major approaches, actors, and actions in global politics. We begin by exploring the major paradigms for understanding international governance. Then we consider the key actors and actions in international relations with a particular emphasis on the international organizations and law. The next section of the course introduces issues about international challenges and the last section of the course engages topical issues of specific international organizations paying special attention on the United Nations, and its chart of special agencies, and the role displayed by regional organizations (European Union (EU), North Atlantic Treaty Organization (NATO), etc.).

The course is designed to provide you with the analytical tools and intellectual frameworks needed to understand the behavior of international organizations and other actors in contemporary world politics (multinational corporations, international non-governmental organizations, and transnational movements). In fact, we will tackle the question “What are international governance, multilateralism, international institutions, and international and regional organizations? From three different perspectives: historical, theoretical and empirical.

**RIN548 Multilateral diplomacy in international and regional organizations 3 cr.**

International organizations mainly the UN and regional organizations like the League of Arab States the European Union among others play an increasingly important role in the world and in different regions. This course offers students insights and practical knowledge about the conduct of multilateral diplomacy in different fields with particular focus on the Middle East.

**RIN550 Terrorism and International Security 3 cr.**

**Pre-requisites** POL211 And POL336 And POL213 And SPO431 And POL321 And POL212

Terrorism has become a major issue in international relations long before 9/11. The Cold War was already the framework of various ideological movements using this method. It has spread and now re-diversify, and is a structural element of world conflicts. International security adapted progressively but is still in search of efficient capacities and strategies. This course will therefore mix various actors and contexts on a dynamic and prospective path. The course has four sections: A. news comments, B. case study, C. theory: concepts and their applicability, D. Simulation Middle East War On Terror (MEWOT).

**RIN552 International Economy 3 cr.**

International economics deals with economic relations between nations. It seeks essentially to account for the reasons for their exchange and for the effects of international trade on the structure of economies. The simplest questions are directly related to foreign trade analysis: Why exchange? Is this a gain or loss? What determines the structure of foreign trade of the countries? How are fix the prices of traded goods fixed, while production costs are not the same in different countries? Other more detailed issues relate to the interaction between trade and economic and social development: How will international integration will affect inequalities between nations? What are the interrelationships between external openness and growth? , and, furthermore, normative trade policy issues, such as: Should imports to be taxed and should we promote exports? These questions are addressed throughout the course.

**SPO431 Principles of Law 3 cr.**

The aim of this course is to introduce the students to the basic legal principles of law applied in Lebanon, with an emphasis on civil law, the penal code, and the commercial code, etc.

**SPO432 Conflict Theories 3 cr.**

This course provides a theoretical approach to conflicts. Through contemporary theories, it assesses the drives towards confrontation and the dynamics of conflicts. The course also classifies the different types of conflicts; for example, intra-state or sub-state, guerrilla wars of independence, etc. It also outlines the forms and economies of violence.

**SPO441 Contemporary Political Thought in the Arab-Muslim World 3 cr.**

This course examines the different political thought of the Arab-Muslim world from the late 19<sup>th</sup> century to present, including fundamentalist political Islam, the Arab national movement of the late 19<sup>th</sup> century, the liberal modernism influenced by West, Arab nationalism against the Franco-British occupation, projects of Arab unity, Arab socialism, and current political Islamism.

**SPO442 Negotiations and Conflict Resolutions 3 cr.**

The understanding of different contexts in which negotiations take place and techniques that are applied to reach certain goals is a crucial foundation for work in legal and political settings in an ever faster changing world with quickly shifting stakeholder interests and thereby naturally arising conflicts, from regional to global levels. Thus, an overview of different conflict scenarios and approaches towards negotiations and conflict resolution needs to be established in order to understand the underlying aspects that have led to impactful developments in the fields of politics, business and international relations.

The main objective of this course is to give the students a broad introduction to different forms of conflicts and their causations as well as measures that led to progress towards resolutions. It also aims to provide the basic analytical and psychological foundations to see through the main aspects of conflicts and to develop tactical and strategic awareness.

The first part of the course will focus on the broader theoretical foundations of negotiations, covering psychological aspects, the role of narratives and the broader international and intercultural playing field. Once these foundations are established the students will apply these skills in the analysis of conflict scenarios based on a broad range of case studies and interactive negotiation activities.

**SPO451 Lebanon's Political Regime 3 cr.**

This course covers, in detail, aspects of the Lebanese political system, the various political powers and their ways of operating, including, the office of the president, cabinet, parliament, and judicial practices. This course also explains the community structure in Lebanon. It also introduces students to the Lebanese Constitution and its evolution since 1926.

**SPO461 Analysis of Political Texts 3 cr.**

21st century politics are strongly controlled by discourses and narratives. International alliances develop or fail based on paradigm shifts. In global battles over hearts and minds the stronger narrative legitimizes actions with global affects and thus reshapes power relations in the international order. This course allows a closer look at the communicational forces that enable or prevent such paradigm shifts in different political arenas.

The analysis of political texts enables students to develop a better understanding of political messages within broader contexts and allows them to analyze political communication strategies in a wide range of fields, from election campaigns over international disputes to counter-terrorism. The development of a rich and varied terminology further allows them to develop and express strong arguments in political debates.

In the first part of the course students learn the tools necessary to analyze political texts and develop contextual awareness in order to understand the role of narratives and discourses within broader political discussions and campaigns. The second part of the course then focuses on the application of qualitative political text analysis tools on different political messages.

# **School of Medicine and Medical Sciences**

## Overview

In accordance with the mission of the Lebanese Maronite Order (O.L.M), with its 300-year tradition and principles, and wishing to contribute to the development of the medical sector and health services in Lebanon, the Holy Spirit University of Kaslik (USEK) created the School of Medicine and Medical Sciences, with the express purpose of providing initial and a continuing education of general practitioners and specialists.

Devoted to helping the development of competent professionals and, simultaneously, to be at the service of all, the School participates in the advancement of knowledge in the field of health and aims to be nationally and internationally recognized for to the excellent quality of its teaching programs. The School's work is based on the values of excellence, humanism, intellectual rigor and the application of high moral standards through a continuously evolving medical education and introduction to research, in the clinical domain, public health and basic research.

Theoretical studies take place at the School and training at the University Hospital Center, "Notre Dame des Secours", in Jbeil.

### Mission

Anchored in the values of the Catholic Church, the School of Medicine and Medical Sciences aims to prepare the current and future generation of leaders in the medical field to become key contributors to improving the well-being of the Lebanese community.

The School's mission is to provide the next generation of medical doctors with high knowledge in basic sciences, world-class medical skills and high ethical standards, who are driven by undebatable sense of service and who strive to continuously improve their capabilities through continuous education and research.

Affiliated to the School of Medicine and Medical Sciences, the Higher Institute of Nursing Sciences, is a university foundation of teaching and research attached to the Holy Spirit University of Kaslik (USEK) and conforming to its statutes.

- In 1981, Our Lady of Help School of Nursing was set up within the premises of Our Lady of Help Hospital at Jbeil (Byblos) in order to provide a training for hospital nurses.
- In 1984, the Ministry of National Education accorded it the status of Institute of training in Nursing Care, dependent on the Department of Technical Education.
- In 1999, this foundation was transformed into a University Institute attached to Holy Spirit University of Kaslik and was accorded the status of Higher Institute of Nursing Sciences by virtue of Decree N° 1948 dated 21/12/1999.

The mission of the Institute is to provide a professional education at university level. This education should allow students to give all the nursing care required for the improvement of public health, the prevention of sickness and the treatment of patients, as well as to fill responsible positions in hospitals and specialized services.

The School of Medicine and Medical Sciences consists of the following departments/institute/programs:

#### Department of Research

#### Department of Medical Sciences

#### Department of Basic Health Sciences

- Bachelor of Science in Health Fundamental Sciences

#### Department of Doctoral Studies

- Doctor of Medicine

#### Postdoctoral Studies Department

- Diploma of Specialized Studies - Anatomical Pathology
- Diploma of Specialized Studies - Anesthesiology
- Diploma of Specialized Studies - Cardiology
- Diploma of Specialized Studies - Cardiovascular and Thoracic Surgery
- Diploma of Specialized Studies - Dermatology

- Diploma of Specialized Studies - Emergency Medicine
- Diploma of Specialized Studies - Endocrinology and Metabolic Disorders
- Diploma of Specialized Studies - ENT
- Diploma of Specialized Studies - Gastro-enterology
- Diploma of Specialized Studies - General Surgery
- Diploma of Specialized Studies - Hematology-Oncology
- Diploma of Specialized Studies – Infectious Diseases
- Diploma of Specialized Studies - Internal Medicine
- Diploma of Specialized Studies - Internal Medicine and Clinical Immunology
- Diploma of Specialized Studies - Laboratory Medicine
- Diploma of Specialized Studies - Nephrology
- Diploma of Specialized Studies - Neurology
- Diploma of Specialized Studies - Neurosurgery
- Diploma of Specialized Studies - Obstetrics and Gynecology (ob-gyn)
- Diploma of Specialized Studies - Ophthalmology
- Diploma of Specialized Studies - Orthopedic Surgery and Traumatology
- Diploma of Specialized Studies - Pediatrics
- Diploma of Specialized Studies - Psychiatry
- Diploma of Specialized Studies - Pulmonology
- Diploma of Specialized Studies - Pulmonary Diseases and Intensive Care Medicine
- Diploma of Specialized Studies - Radiology
- Diploma of Specialized Studies - Urology

**Department of Hospitalo-University**

**Higher Institute of Nursing Sciences**

- Bachelor of Science in Nursing Sciences

## Administration and Full-time Faculty

Dr. Hanna Mattar, Associate Professor, **Dean**

Prof. Walid Hleihel, Professor, **Associate Dean**

Dr. Antoine Kosseify, Associate Professor, **Associate Dean for Medical Affairs**

Prof. Georges Nohra, Professor, **Associate Dean for Continuous Medical Education**

### **Professors:**

Prof. Alex Jalkh

Prof. Edouard Chaiban Elias

Prof. Jean-Claude Lahoud

### **Associate Professors:**

Dr. Amale Sukkarieh Chelala

Dr. Charbel Yazbek

Dr. Christian Haddad

Dr. Elias Makhoul

Dr. Elie Chelala

Dr. Elissar Dagher Nohra

Dr. Fadi Hoyek

Dr. Georges Merheb

Dr. Issa Issa

Dr. Issam Maalouf

Dr. Kamal Kallab

Dr. Marie-Claude Fadous Khalifé

Dr. Marcel Massoud

Dr. Maroun Khattar

Dr. Monique Tabet

Dr. Myriam Al Amm

Dr. Nabil Tawil

Dr. Rabih Hallit

Dr. Raghid El Khoury

Dr. Saad Khairallah

Dr. Saadé Abboud

Dr. Souhail Chamandi

Dr. Souheil Hallit

Dr. Wadih Ghanameh

Dr. Walid El Khoury

Dr. Ziad El Khoury

Dr. Zaki Ghorayeb

### **Assistant Professors:**

Dr. Alexandre Kharma

Dr. Alexandre Schakal

Dr. Ali Fadlallah Yahya

Dr. Amal Bassile Harb

Dr. Ameen Samaha

Dr. Antoine Kassis

Dr. Antoine Abdel Jalil

Dr. Bassam Romanos

Dr. Elias Khoury

Dr. Emile Andari

Dr. Fady Nasr

Dr. Georges Abi Aad

Dr. Georges Nicolas

Dr. Hamid El Bayeh

Dr. Juliana Menassa Saabi

Dr. Madona Matar Lahoud

Dr. Neemtallah Basile

Dr. Norma Ghosn Hakim

Dr. Patrick Zaarour

Dr. Peter Noun

Dr. Philip Rouadi

Dr. Pierre Khoury Edde

Dr. Samir Tarraf

Dr. Seba Mhanna

Dr. Walid Harb

### **Lecturers:**

Mr. Charbel El Houwayek

Mr. Marcel Moukarzel

## Undergraduate Programs

### Bachelor of Science in Health Fundamental Sciences (Hybrid<sup>i</sup>)

#### Mission

The mission of the Bachelor of Sciences program in Fundamental Health Sciences is to provide students basic sciences, basic medical sciences, general education, and ethical skills as a foundation for medical studies or other health specialties. The program is committed to providing quality and innovative teaching through expertise in the basic medical sciences in the servicing of undergraduate and postgraduate programs.

#### Program Educational Objectives

1. Graduates will have the basic knowledge, skills, behaviors, and attitudes that will enable them to pursue their education in medicine or in health sciences.
2. Graduates will be able to pursue careers in the fields of health management, public health, and scientific branches.
3. Graduates will be able to pursue postgraduate and PhD studies.

#### Program Outcomes

- a. Students will cultivate skills to become engaged and active citizens with critical and appreciative understanding of religious tradition, ethical theories and moral development.
- b. Students will acquire knowledge in basic sciences as prerequisites to basic medical sciences.
- c. Students will acquire knowledge in basic medical sciences, a basis for understanding diseases.
- d. Students will develop skills in handling basic epidemiologic methods and statistical principles that underlie evidence-based medicine as well as socio-economic issues related to health.
- e. Students will integrate the ethical principles of the medical profession as well as the psychological aspects of illness.
- f. Students will initiate basic life support procedures to the sick or injured until advanced medical aid is available, or the urgency of the situation has been controlled.

#### Degree Requirements

This program requires 110 credits for students entering at the sophomore level (holders of freshman or a recognized baccalaureate - equivalent to 30 credits), distributed as following:

|                                                        |           |
|--------------------------------------------------------|-----------|
| English Communication*                                 | 3         |
| Sports*                                                | 1         |
| Religious Sciences*                                    | 3         |
| <b>Behavioral, Social Sciences and History</b>         | <b>11</b> |
| History of Lebanon*                                    | 3         |
| PSY201 - Introduction to Psychology*                   | 3         |
| SOC217 - Citizen and Civic Engagement*                 | 2         |
| SRO217 - Bioethics*                                    | 3         |
| <b>Basic Sciences</b>                                  | <b>26</b> |
| BCH320 - Structural Biochemistry                       | 3         |
| BCH421 - Metabolic Biochemistry                        | 3         |
| BIO377 - Biochemistry and Molecular Biology Laboratory | 1         |
| BIO413 - Molecular Biology                             | 3         |
| CHM212 - General Chemistry*                            | 3         |
| CHM317 - Organic Chemistry                             | 3         |
| CHM377 - General Chemistry and Physics Laboratory      | 1         |
| INF308 - Applied Computer Sciences*                    | 3         |
| MAT216 - General Mathematics*                          | 3         |
| PHY210 - General Physics*                              | 3         |
| <b>Basic Medical Sciences</b>                          | <b>66</b> |

<sup>i</sup> Hybrid: Courses offered in French and/or English

|                                                            |            |
|------------------------------------------------------------|------------|
| MEDL200 - Cytology and Human Cell Pathologies              | 3          |
| MEDL205 - General Histology                                | 3          |
| MEDL210 - Musculoskeletal Anatomy                          | 3          |

| <b>Total</b>                                               | <b>110</b> |

*\*Courses that fulfil the USEK General Education Requirements (total of 30 credits).*

## Bachelor of Science in Nursing Sciences (Hybrid<sup>i</sup>)

### Accreditation

This program is accredited by the Applied and Natural Science Accreditation Commission of ABET, <http://www.abet.org>

### Mission

The mission of the department is to train university-level nurses to provide preventive, curative, and palliative care, and to promote, preserve or restore health. Such interventions contribute to the education and to the health of individuals or groups of people and take place, whether autonomously or collaboratively, within the framework of a multidisciplinary team in all areas of activity in the nursing profession.

### Program Educational Objectives

1. Graduates will have the theoretical, technical and relational knowledge needed to understand and take care of the health needs of individuals or groups of people within the framework of a multidisciplinary team.
2. Graduates will conduct self-assessment, scientific curiosity and critical awareness in order to improve the quality of nursing care and professional practices, and have the ability to acquire new knowledge quickly and adapt to various situations.

<sup>i</sup> Hybrid: Courses offered in French and/or English

3. Graduates will have values based on respect for individuals and their rights, thus exercising professional ethical behavior, allowing them to make informed decisions and act with autonomy and responsibility within the scope of their function.

#### Student Outcomes

- g. An ability to apply knowledge in applied science and natural science to relevant fields of nursing science.
- h. An ability to assess a clinical situation and formulate a nursing diagnosis.
- i. An ability to plan and conduct a nursing project.
- j. An ability to apply and use the knowledge, gestures and modern technical and scientific tools needed for nursing practice.
- k. An ability to identify complications or risks associated with care and / or disease and provide appropriate solutions.
- l. Ability to initiate and implement educational and preventive care and / or projects in an individual, societal and global context.
- m. An ability to communicate and lead an effective connection in a care setting.
- n. An ability to analyze and improve professional practice, and engage in training.
- o. An understanding of professional and ethical responsibility.
- p. An ability to organize and coordinate care interventions and those related to trainee training, as part of a multidisciplinary team.
- q. A capacity to understand contemporary issues related to public and community health.

#### Degree Requirements

This program requires 110 credits for students entering at the sophomore level (holders of freshman or a recognized baccalaureate - equivalent to 30 credits), distributed as following:

|                                                            |           |

## Doctoral Programs

### Doctorate of Medicine (Hybrid<sup>i</sup>)

#### Mission

The mission of the Doctorate of Medicine program is to improve the well-being of the Lebanese community by training current and future generation of general practitioners by providing them high knowledge in basic sciences, world-class medical skills, and high ethical standards. The program prepares graduates for different specializations in medicine, who are driven by undebatable sense of service and who strive to continuously improve their capabilities through continuous education and research.

#### Program Educational Objectives

Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate:

##### A. Expertise in the medical field and profession

- A.1. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate knowledge in the principles of biomedical sciences, psychology, social sciences, public health, epidemiology, healthcare systems, basic healthcare economics, medical research, technology, and ethics.
- A.2. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate knowledge of established and emerging principles of clinical sciences.
- A.3. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate ability to gather essential and accurate information about patients and their conditions through history-taking, physical examination, mental state examination, laboratory data, imaging and other medical tests.
- A.4. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate clinical reasoning and critical thinking skills such as problem formulation, development of diagnostic hypotheses, formulating a course of action and the development of a monitoring plan.
- A.5. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate clinical reasoning skills to diagnostic and therapeutic decision-making, clinical problem-solving, and other aspects of evidence-based health care.
- A.6. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate ability to perform all medical and surgical procedures considered essential for the area of practice.
- A.7. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate knowledge in skills and procedures of diverse medicine specializations.

<sup>i</sup> Hybrid: Courses offered in French and/or English

A.8. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate skills to organize and prioritize responsibilities to provide care that is safe, effective, and efficient.

**B - Communication skills**

B.1. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate communication skills that result in effective exchange of information and collaboration with patients and their families.

B.2. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate communication skills that result in effective exchange of information and collaboration with other health professionals.

B.3. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate ability to produce written documentation of clinical activities.

**C - Collaboration skills**

C.1. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate ability to work within a multidisciplinary team in a responsive and responsible manner to provide patient -and population- centered care that is safe, timely, efficient, effective, and equitable.

C.2. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate ability to work with the authorities especially in national emergency situations.

D.1. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate ability to call effectively on other resources in the health care system to provide optimal health care.

D.2. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate ability to promote public health.

**D - Health promotion activities**

D.3. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate ability to meet the needs of the Lebanese society.

D.4. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate awareness of the concept of public health and responsiveness to emerging situations at national, regional and global levels.

**E - Lifetime educational commitment**

E.1. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate qualities required to sustain lifelong personal and professional growth.

E.2. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate ability to search for and use publications and international literature to improve their performances.

**F - Management skills**

F.1. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate ability to manage their practice.

F.2. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate awareness of stress management.

F.3. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate qualities required to organize the work within a team.

**G - Ethics**

G.1. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate commitment to the values of USEK and the code of conducts of the School of Medicine and Medical Sciences.

G.2. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate commitment to the moral, ethical, and professional principles as laid out in the Physician's Pledge.

G.3. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate commitment to the Lebanese Medical Ethics Law, and the Lebanese Act on the Rights of Patients and Informed Consent.

**H - Adequate preparation for future careers**

H.1. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate ability to take national and international exams and apply to residency programs.

H.2. Physicians graduated from the School of Medicine and Medical Sciences at USEK will demonstrate ability to pursue a professional career in health care system administration, research and medical education.

## Postdoctoral Programs

### Diploma of Specialized Studies – Anatomical Pathology (Hybrid<sup>i</sup>)

#### Mission

The mission of the pathology residency program is to provide trainees the opportunity to acquire the subject knowledge, procedural skills, professional attitudes and practical experience. The main challenge remains the multidisciplinary of both the diseases and the specialists to collaborate with.

#### Program Educational Objectives

1. Graduates must use their basic and clinical knowledge acquired during the specialization path in order to diagnose diseases and support the team for the best treatment of the patient.
2. Must collaborate with colleagues (their lab skills, their clinical skills) for a better diagnosis.
3. Must improve their knowledge and skills in parallel to the new technological discoveries and put them to the service of patients according to the rules of professionalism and ethics.
4. Have to practice their profession in accordance with the principles of quality, in particular the principles of efficiency and equity.

#### Program Outcomes

At the end of the program, the young pathologists will:

- a. Master the basic knowledge in order to analyze the specimen, to then propose an adequate diagnosis.
- b. Acquire deep knowledge in other specialties (nearly everything) to integrate the morphological pattern in the pathology of the disease.
- c. Be prepared to use new knowledge and new techniques to improve their practice.
- d. Master the gestures and techniques (biopsy, autopsy, cytopathology) plus those proper to the specialty and apply them according to the rules of professionalism and ethics.
- e. Collaborate with other clinical or paraclinical specialists, respecting the principle of efficiency and in the best interest of the patient.
- f. Share their knowledge with peers, students and other healthcare professionals.

<sup>i</sup> Hybrid: Courses offered in French and/or English

## Diploma of Specialized Studies – Anesthesiology (Hybrid<sup>i</sup>)

### Mission

The mission of the anesthesia residency program is to provide state-of-the-art patient care in the areas of pre-operative evaluation, intraoperative anesthesia, post-operative critical care and pain management.

Students will not only be skilled in the procedural aspects of the specialty but also have a strong base in the cognitive aspects of it.

### Program Educational Objectives

1. Graduates must use their basic and clinical knowledge acquired during the specialization path in order to support and treat the patient (in the OR and ICU) within the specialty but without forgetting their skills in general practice.
2. Graduates must support the patient psychologically and morally, and the family and entourage for better acceptance.
3. Graduates must improve their knowledge and skills in parallel to the new technological discoveries and put them to the service of their patients according to the rules of professionalism and ethics.
4. Graduates have to practice their profession in accordance with the principles of quality, in particular the principles of efficiency and equity.
5. Graduates must share their knowledge and promote prevention principles and other public health principles.

### Program Outcomes

At the end of the program, the young anesthesiologists will:

- a. Master the basic knowledge and clinical knowledge in anesthesia and resuscitation in order to analyze the clinical situation, to propose a course of action and the appropriate treatment and be ready to act quickly in urgent cases.
- b. Acquire deep knowledge in other specialties (cardiology, pneumatology, nephrology ...) for a better practice.
- c. Be able to take charge of a patient and provide moral and psychological support to the patient and entourage.
- d. Be prepared to use new knowledge and new techniques to improve their practice.
- e. Master the gestures and techniques (intubation, work with dangerous drugs, central lines, etc.) and apply them according to the rules of professionalism and ethics.
- f. Collaborate with other clinical or paraclinical specialists, respecting the principle of efficiency and in the best interest of the patient.
- g. Share their knowledge with peers, students and other healthcare professionals.
- h. Promote the principles of prevention and other public health principles.

## Diploma of Specialized Studies – Cardiology (Hybrid<sup>i</sup>)

### Mission

The mission of the cardiology residency program is to educate MD graduates to evaluate and manage critically ill patients requiring advanced cardiology therapies, through a multidisciplinary team approach. They will be introduced to all cardiology sub-specialties.

### Program Educational Objectives

1. Graduates must use their basic and clinical knowledge acquired during the specialization path in order to support and treat the patient within their specialty, but without forgetting their skills in general practice.
2. Must support the patient psychologically and morally, and the family and entourage for better therapeutic compliance.
3. Must improve their knowledge and skills in parallel to the new technological discoveries and put to the service of their patient according to the rules of professionalism and ethics.
4. Have to practice their profession in accordance with the principles of quality, in particular the principles of efficiency and equity.
5. Must share their knowledge and promote prevention principles and other public health principles.

### Program Outcomes

At the end of the program, the young cardiologists will:

- a. Master the basic knowledge and clinical knowledge in cardiology in order to analyze the clinical situation, to propose a course of action and the appropriate treatment and be ready to act quickly upon urgent cases.
- b. Acquire a deep knowledge in other specialties (sister and/or complementary and / or additional).
- c. Be able to take charge of a patient and provide moral and psychological support to the patient and entourage.
- d. Be prepared to use new knowledge and new techniques to improve their practice.
- e. Master the gestures and techniques (ECG, US, KT) proper to the specialty and apply them according to the rules of professionalism and ethics.
- f. Collaborate with other clinical or paraclinical specialists, respecting the principle of efficiency and in the best interest of the patient.
- g. Share their knowledge with peers, students and other healthcare professionals.
- h. Promote the principles of prevention and other public health principles (specific to cardiology without forgetting their skills as generalists).

## Diploma of Specialized Studies - Cardiovascular and Thoracic Surgery (Hybrid<sup>i</sup>)

### Mission

The thoracic and cardiovascular surgery residency program provides residents with the range and depth of academic experience and academic exposure required to develop superior surgical skills and an ability to make mature, informed, independent judgments with high professional standards.

### Program Educational Objectives

1. Graduates must use their basic and clinical knowledge acquired during the specialization path in order to support and treat the patient within the specialty, but without forgetting their skills in general practice.
2. Must support the patient psychologically and morally, and the family and entourage for better therapeutic compliance.
3. Must improve their knowledge and skills in parallel to the new technological discoveries and put to the service of their patients according to the rules of professionalism and ethics.
4. Have to practice their profession in accordance with the principles of quality, in particular the principles of efficiency and equity.
5. Must share their knowledge and promote prevention principles and other public health principles.

### Program Outcomes

At the end of the program, young cardio- thoracic surgeons will:

- a. Master the basic knowledge and clinical knowledge of the specialty in order to analyze the clinical situation, to propose a course of action and the appropriate treatment and be ready to act quickly in urgent cases.
- b. Acquire deep knowledge in other specialties, surgery, cardiology pulmonary etc., in order to better perform their practice.
- c. Be able to take charge of a patient and provide moral and psychological support to the patient and entourage.
- d. Be prepared to use new knowledge and new techniques to improve their practice.
- e. Master the gestures and techniques (surgical, resuscitation) proper to their specialty and apply them according to the rules of professionalism and ethics (to be defined).
- f. Collaborate with other clinical or paraclinical specialists, respecting the principle of efficiency and in the best interest of the patient.

<sup>i</sup> Hybrid: Courses offered in French and/or English

- g. Share their knowledge with peers, students and other healthcare professionals.
- h. Promote the principles of prevention and other public health principles (specific to their specialty without forgetting their skills as generalists).

### Diploma of Specialized Studies - Dermatology (Hybrid<sup>i</sup>)

#### Mission

The mission of the dermatology residency program is to provide trainees the opportunity to acquire knowledge, procedural skills, professional attitudes and practical experience in the subjects of medical dermatology and cosmetology.

#### Program Educational Objectives

1. Graduates must use their basic and clinical knowledge acquired during the specialization path in order to support and treat the patient within the specialty, but without forgetting their skills in general practice.
2. Must support the patient psychologically and morally, and the family and entourage for better therapeutic compliance.
3. Must improve their knowledge and skills in parallel to the new technological discoveries and put them to the service of their patients according to the rules of professionalism and ethics.
4. Have to practice their profession in accordance with the principles of quality, in particular the principles of efficiency and equity.
5. Must share their knowledge and promote prevention principles and other public health principles.

#### Program Outcomes

<sup>i</sup> Hybrid: Courses offered in French and/or English

At the end of the program, the young dermatologists will:

- Master the basic knowledge and clinical knowledge of the specialty in order to analyze the clinical situation, to propose a course of action and the appropriate treatment and be ready to act quickly upon urgent cases.
- Acquire deep knowledge in other specialties (especially medical specialties).
- Be able to take charge of a patient and provide moral and psychological support to the patient and entourage.
- Be prepared to use new knowledge and new techniques to improve their practice.
- Master the gestures and techniques (medical, dermic surgery and cosmetology) and apply them according to the rules of professionalism and ethics.
- Collaborate with other clinical or paraclinical specialists, respecting the principle of efficiency and in the best interest of the patient.
- Share their knowledge with peers, students and other healthcare professionals.
- Promote the principles of prevention (sun, STD) and other public health principles.

## Diploma of Specialized Studies - Emergency Medicine (Hybrid<sup>i</sup>)

### Mission

The mission of the emergency medicine program is to advance the specialty for the direct benefit of the patients by educating, mentoring, and developing future leaders in emergency medicine, whether they devote their efforts to advancing emergency prehospital care, research, public health, or public policy. We aim to be collaborative, across disciplines, specialties and health systems.

### Program Educational Objectives

1. Graduates must use their basic and clinical knowledge acquired during the specialization path in order to support and treat the patient within their specialty, but without forgetting their skills in general practice.

<sup>i</sup> Hybrid: Courses offered in French and/or English

2. Must support the patient psychologically and morally, and the family and entourage for better therapeutic compliance.
3. Must improve their knowledge and skills in parallel to the new technological discoveries and put them to the service of their patients according to the rules of professionalism and ethics.
4. Have to practice their profession in accordance with the principles of quality, in particular the principles of efficiency and equity.
5. Must share their knowledge and promote prevention principles and other public health principles.

#### **Program Outcomes**

At the end of the program, the young emergency specialists will:

- a. Master the basic knowledge and clinical knowledge of both medical and surgical and critical situations in order to analyze the clinical situation, to propose a course of action and the appropriate treatment and be ready to act quickly.
- b. Acquire deep knowledge in other specialties.
- c. Be able to take charge of a patient and provide moral and psychological support to the patient and entourage.
- d. Be prepared to use new knowledge and new techniques to improve their practice.
- e. Master the gestures and techniques (medical, surgical and critical care) and apply them according to the rules of professionalism and ethics.
- f. Collaborate with other clinical or paraclinical specialists, respecting the principle of efficiency and in the best interest of the patient.
- g. Share their knowledge with peers, students and other healthcare professionals.
- h. Promote the principles of prevention and other public health principles.
- i. Be able to dispatch patients and take priority choices.

## Diploma of Specialized Studies - Endocrinology and Metabolic Disorders (Hybrid<sup>i</sup>)

### Mission

The mission of the program is to educate physicians to become outstanding clinicians, teachers and scientists in the broad field of Endocrinology and Metabolism for the improvement of patient care and public health.

### Program Educational Objectives

#### A. Patient Care

Fellows must be able to provide patient care that is compassionate, appropriate, and effective for the treatment of health problems and the promotion of health.

Fellows are expected to:

- A.1. Communicate effectively and demonstrate caring and respectful behaviors when interacting with patients and their families.
- A.2. Gather essential and accurate information about their patients.
- A.3. Make informed decisions about diagnostic and therapeutic interventions based on patient information and preferences, up-to-date scientific evidence, and clinical judgment.
- A.4. Develop and carry out patient management plans.
- A.5. Counsel and educate patients and their families.
- A.6. Use information technology to support patient care decisions and patient education.
- A.7. Perform competently all medical and invasive procedures considered essential for the area of practice.
- A.8. Provide health care services aimed at preventing health problems or maintaining health.
- A.9. Work with health care professionals, including those from other disciplines, to provide patient-focused care.

#### B. Medical Knowledge

Fellows must demonstrate knowledge about established and evolving biomedical, clinical, and cognate (e.g. epidemiological and social-behavioral) sciences and the application of this knowledge to patient care.

Fellows are expected to:

- B.1. Demonstrate an investigatory and analytic thinking approach to clinical situations.
- B.2. Know and apply the basic and clinically supportive sciences which are appropriate to their discipline.

#### C. Practice-Based Learning and Improvement

Fellows must be able to investigate and evaluate their patient care practices, appraise and assimilate scientific evidence, and improve their patient care practices.

Fellows are expected to:

- C.1. Analyze practice experience and perform practice-based improvement activities using a systematic methodology.
- C.2. Locate, appraise, and assimilate evidence from scientific studies related to their patients' health problems.
- C.3. Obtain and use information about their own population of patients and the larger population from which their patients are drawn.
- C.4. Apply knowledge of study designs and statistical methods to the appraisal of clinical studies and other information on diagnostic and therapeutic effectiveness.
- C.5. Use information technology to manage information, access on-line medical information; and support their own education.
- C.6. Facilitate the learning of students and other health care professionals.

#### D. Interpersonal and Communication Skills

Fellows must be able to demonstrate interpersonal and communication skills that result in effective information exchange and teaming with patients, their patients' families, and professional associates.

Fellows are expected to:

- D.1. Create and sustain a therapeutic and ethically sound relationship with patients.

---

<sup>i</sup> Hybrid: Courses offered in French and/or English

D.2. Use effective listening skills and elicit and provide information using effective nonverbal, explanatory, questioning, and writing skills.

D.3. Work effectively with others as a member or leader of a health care team or other professional group.

#### **E. Professionalism**

Fellows must demonstrate a commitment to carrying out professional responsibilities, adherence to ethical principles, and sensitivity to a diverse patient population.

Fellows are expected to:

E.1. Demonstrate respect, compassion, and integrity; a responsiveness to the needs of patients and society.

E.2. That supersedes self-interest; accountability to patients, society, and the profession; and a commitment to excellence and on-going professional development.

E.3. Demonstrate a commitment to ethical principles pertaining to provision or withholding of clinical care, confidentiality of patient information, informed consent and business practices.

E.4. Demonstrate sensitivity and responsiveness to patients' culture, age, gender, and disabilities.

#### **F. Systems-Based Practice**

Fellows must demonstrate an awareness of and responsiveness to the larger context and system of health care and the ability to effectively call on system resources to provide care that is of optimal value.

Fellows are expected to:

F.1. Understand how their patient care and other professional practices affect other health care professionals, the health care organization, and the larger society and how these elements of the system affect their own practice.

F.2. Know how types of medical practice and delivery systems differ from one another, including methods of controlling health care costs and allocating resources.

F.3. Practice cost-effective health care and resource allocation that does not compromise quality of care.

F.4. Advocate for quality patient care and assist patients in dealing with system complexities.

F.5. Know how to partner with health care managers and health care providers to assess, coordinate, and improve health care and know how these activities can affect system performance.

#### **Degree Requirements**

## Diploma of Specialized Studies - ENT (Hybrid<sup>i</sup>)

### Mission

The fundamental purpose of the training program in otorhinolaryngology (ENT) is to educate and train physicians to function independently as specialists in the field of otorhinolaryngology – head and neck surgery. They will be trained to practice their skills with a high level of professionalism.

### Program Educational Objectives

1. Graduates must use their basic and clinical knowledge acquired during the specialization path in order to support and treat the patient within the specialty, but without forgetting their skills in general practice.
2. Must support the patient psychologically and morally, and the family and entourage for better therapeutic compliance.
3. Must improve their knowledge and skills in parallel to the new technological discoveries and put them to the service of their patients according to the rules of professionalism and ethics.
4. Have to practice their profession in accordance with the principles of quality, in particular the principles of efficiency and equity.
5. Must share their knowledge and promote prevention principles and other public health principles.

### Program Outcomes

At the end of the program, the young ENT specialists Will:

- a. Master the basic knowledge and clinical knowledge of the specialty in order to analyze the clinical situation, to propose a course of action and the appropriate treatment and be ready to act quickly in urgent cases.
- b. Acquire deep knowledge in other specialties (sister and/or complementary and / or additional).
- c. Be able to take charge of a patient and provide moral and psychological support to the patient and entourage.
- d. Be prepared to use new knowledge and new techniques to improve their practice.
- e. Master the gestures and techniques (to be specified) proper to their specialty and apply them according to the rules of professionalism and ethics.
- f. Collaborate with other clinical or paraclinical specialists, respecting the principle of efficiency and in the best interest of the patient.
- g. Share their knowledge with peers, students and other healthcare professionals.
- h. Promote the principles of prevention and other public health principles (specific to their specialty without forgetting their skills as generalists).

## Diploma of Specialized Studies - Gastro-enterology (Hybrid<sup>i</sup>)

### Mission

The mission of the gastro-enterology residency program is to improve medical care by providing the best specialists in the field through better education and research. They will acquire knowledge, technical skills and especially ethical skills in order to best serve their society.

### Program Educational Objectives

1. Graduates must use their basic and clinical knowledge acquired during the specialization path in order to support and treat the patient within their specialty but without forgetting their skills in general practice.
2. Must support the patient psychologically and morally, and the family and entourage for better therapeutic compliance.
3. Must improve their knowledge and skills in parallel to the new technological discoveries and put them to the service of their patients according to the rules of professionalism and ethics.
4. Have to practice their profession in accordance with the principles of quality, in particular the principles of efficiency and equity.
5. Must share their knowledge and promote prevention principles and other public health principles.

### Program Outcomes

At the end of the program, the young GI specialists will:

- a. Master the basic knowledge and clinical knowledge of the specialty in order to analyze the clinical situation, to propose a course of action and the appropriate treatment and be ready to act quickly in urgent cases.
- b. Acquire deep knowledge in other specialties (internal medicine, rheumatology, general surgery, etc.).
- c. Be able to take charge of a patient and provide moral and psychological support to the patient and entourage.
- d. Be prepared to use new knowledge and new techniques to improve their practice.
- e. Master the gestures and techniques (biopsies, endoscopy) proper to their specialty and apply them according to the rules of professionalism and ethics.
- f. Collaborate with other clinical or paraclinical specialists, respecting the principle of efficiency and in the best interest of the patient.
- g. Share their knowledge with peers, students and other healthcare professionals.
- h. Promote the principles of prevention and other public health principles (specific to their specialty without forgetting their skills as generalists).

## Diploma of Specialized Studies - General Surgery (Hybrid<sup>i</sup>)

### Mission

The general surgery residency program will train general surgeons with a comprehensive approach in the state-of-the-art field of general surgery (neck, breast, gastro-intestinal, oncological, endocrine surgery and all aspects of laparoscopy) to provide residents with first-hand experience of managing surgical patients in a variety of surgical areas by developing their technical, professional and ethical skills according to the values of our institution.

### Program Educational Objectives

1. Graduates must use their basic and clinical knowledge acquired during the specialization path in order to support and treat the patient within the specialty, but without forgetting their skills in general practice.
2. Must support the patient psychologically and morally, and the family and entourage for better therapeutic compliance.
3. Must improve their knowledge and skills in parallel to the new technological discoveries and put them to the service of their patients according to the rules of professionalism and ethics.
4. Have to practice their profession in accordance with the principles of quality, in particular the principles of efficiency and equity.
5. Must share their knowledge and promote prevention principles and other public health principles.

### Program Outcomes

At the end of the program, the young specialists will:

- a. Master the basic knowledge and clinical knowledge of the specialty in order to analyze the clinical situation, to propose a course of action and the appropriate treatment and be ready to act quickly in urgent cases.
- b. Acquire deep knowledge in other specialties (all surgical specialties, plus more medical).
- c. Be able to take charge of a patient and provide moral and psychological support to the patient and entourage.
- d. Be prepared to use new knowledge and new techniques to improve their practice.
- e. Master the gestures and techniques proper to their specialty (surgery, endoscopic surgery...) and apply them according to the rules of professionalism and ethics.
- f. Collaborate with other clinical or paraclinical specialists, respecting the principle of efficiency and in the best interest of the patient.
- g. Share their knowledge with peers, students and other healthcare professionals.

<sup>i</sup> Hybrid: Courses offered in French and/or English

- h. Promote the principles of prevention and other public health principles (specific to their specialty without forgetting their skills as generalists).

## Diploma of Specialized Studies - Infectious Diseases

### Mission

The Mission of the Infectious Diseases Residency Program is to train MD graduates on how to manage patients with complex medical needs, providing them with high quality, cost effective, compassionate and outstanding medical care. We aim to graduate clinical and academic national leaders in Infectious Diseases.

### Program Educational Objectives

- 1- Graduates must be able to provide patient care that is compassionate, appropriate, and effective for the treatment of health problems and the promotion of public health principles.
- 2- Graduates must demonstrate knowledge about established and evolving biomedical, clinical, epidemiological and social-behavioral sciences and its application within daily patient care.

3- Graduates must be able to investigate and evaluate their patient care practices, appraise and assimilate scientific evidence, to improve their quality of care.

4- Graduates must be able to demonstrate interpersonal and communication skills that result in effective information exchange and teaming with patients, their patients families, and professional associates.

5- Graduates must demonstrate a commitment to carrying out professional responsibilities, adherence to ethical principles, and sensitivity to a diverse patient population.

6- Graduates must demonstrate an awareness of and responsiveness to the larger context and system of health care and the ability to effectively call on system resources to provide care that is of optimal value.

### Program Outcomes

At the end of the program, the young Infectious Diseases specialists will:

- a. demonstrate a commitment to carrying out professional responsibilities
- b. be able to manage inpatient and outpatient with commitment to high quality of care
- c. be capable of managing immunocompetent as well as immunocompromised patients equally
- d. understand the epidemiology of different Infectious Diseases and collaborate with the Ministry of Health at the national and international level
- e. promote Infection Control and Antimicrobial Stewardship Education
- f. promote Public Health within the community
- g. lead research projects related to Infectious Diseases at the hospital and university level

## Diploma of Specialized Studies - Internal Medicine (Hybrid<sup>i</sup>)

### Mission

The mission of the internal medicine residency program is to train and foster the development of future experts in the field and to train future generations of specialists who will not only be skilled in the procedural aspects of the specialty but also in the ethical rules that guide their practice.

### Program Educational Objectives

1. Graduates must use their basic and clinical knowledge acquired during the specialization path in order to support and treat the patient within the specialty, but without forgetting their skills in general practice.
2. Must support the patient psychologically and morally, and the family and entourage for better therapeutic compliance.
3. Must improve their knowledge and skills in parallel to the new technological discoveries and put them to the service of patients according to the rules of professionalism and ethics.
4. Have to practice their profession in accordance with the principles of quality, in particular the principles of efficiency and equity.
5. Must share their knowledge and promote prevention principles and other public health principles.

### Program Outcomes

At the end of the program, the young specialists will:

- a. Master the basic knowledge and clinical knowledge of the internal medicine domain in order to analyze the clinical situation, to propose a course of action and the appropriate treatment and be ready to act quickly in urgent cases.
- b. Acquire deep knowledge in other specialties.
- c. Be able to take charge of a patient and provide moral and psychological support to the patient and entourage.
- d. Be prepared to use new knowledge and new techniques to improve their practice.
- e. Master the gestures and techniques proper to their specialty and apply them according to the rules of professionalism and ethics
- f. Collaborate with other clinical or paraclinical specialists, respecting the principle of efficiency and in the best interest of the patient.
- g. Share their knowledge with peers, students and other healthcare professionals.
- h. Promote the principles of prevention and other public health principles (specific to their specialty without forgetting their skills as generalists).

## Diploma of Specialized Studies - Internal Medicine and Clinical Immunology (Hybrid<sup>i</sup>)

### Mission

The mission of the internal medicine residency program is to train and foster the development of future experts in the field and to train future generations of specialists who will not only be skilled in the procedural aspects of the specialty but also in the ethical rules that guide their practice.

### Program Educational Objectives

6. Graduates must use their basic and clinical knowledge acquired during the specialization path in order to support and treat the patient within the specialty, but without forgetting their skills in general practice.
7. Must support the patient psychologically and morally, and the family and entourage for better therapeutic compliance.
8. Must improve their knowledge and skills in parallel to the new technological discoveries and put them to the service of patients according to the rules of professionalism and ethics.
9. Have to practice their profession in accordance with the principles of quality, in particular the principles of efficiency and equity.
10. Must share their knowledge and promote prevention principles and other public health principles.

### Program Outcomes

At the end of the program, the young specialists will:

- i. Master the basic knowledge and clinical knowledge of the internal medicine domain in order to analyze the clinical situation, to propose a course of action and the appropriate treatment and be ready to act quickly in urgent cases.
- j. Acquire deep knowledge in other specialties.
- k. Be able to take charge of a patient and provide moral and psychological support to the patient and entourage.
- l. Be prepared to use new knowledge and new techniques to improve their practice.
- m. Master the gestures and techniques proper to their specialty and apply them according to the rules of professionalism and ethics
- n. Collaborate with other clinical or paraclinical specialists, respecting the principle of efficiency and in the best interest of the patient.
- o. Share their knowledge with peers, students and other healthcare professionals.
- p. Promote the principles of prevention and other public health principles (specific to their specialty without forgetting their skills as generalists).

## Diploma of Specialized Studies - Laboratory Medicine (Hybrid<sup>i</sup>)

### Mission

The mission of the residency in Laboratory Medicine is the training of physicians who are specialized in the field of laboratory medicine and who can contribute to the healthcare system of the country by acting as support to other clinical specialties. Moreover, the aim of the program is to graduate specialized doctors with the appropriate skills and knowledge and with ethics in line with the mission of the Lebanese Maronite Order (O.L.M.).

### Program Educational Objectives

1. Graduates will be able to manage a laboratory in both the private and/or hospital setting.
2. Graduates may also ultimately work in the polyvalent, specialized or research tracks.
3. Graduates will be able to use both the fundamental and specialized knowledge for the processing of and the validation of the interpretation of various laboratory tests.
4. Graduates will be able to function in multidisciplinary teams in respect to ethical codes of the profession.

### Program Outcomes

- a. The Students of the residency in clinical pathology will have both the fundamental and specialized knowledge for the processing and the clinical interpretation of various laboratory tests.
- b. Aid the patient's primary treating team in reaching a diagnosis in the most appropriate and efficient ways.
- c. Acquire communication skills to ensure proper collaboration with other health care professionals in a multi-disciplinary setting.
- d. Be trained to take responsibility, recognize limitations and be ethical in their dealings with colleagues and patients.
- e. The students will master the management and the organizational operations of the laboratory.
- f. There will also be an emphasis on quality assurance and the judicious use of available resources and finances.
- g. They will learn to stay up to date by critically reading literature and studies relevant to the specialty and will be encouraged and taught to contribute to the medical literature by conducting research and writing medical papers.

## Diploma of Specialized Studies – Nephrology (Hybrid<sup>i</sup>)

### Mission

The mission of our nephrology training program is to provide each trainee with a broad range of experiences in nephrology including scientific, technical and ethical skills and the knowledge necessary for the preparation of a successful career as an academic leader or a clinical practitioner.

### Program Educational Objectives

1. Graduates must use their basic and clinical knowledge acquired during the specialization path in order to support and treat the patient within the specialty, but without forgetting their skills in general practice.
2. Must support the patient psychologically and morally, and the family and entourage for better therapeutic compliance.
3. Must improve their knowledge and skills in parallel to the new technological discoveries and put them to the service of patients according to the rules of professionalism and ethics.
4. Have to practice their profession in accordance with the principles of quality, in particular the principles of efficiency and equity.
5. Must share their knowledge and promote prevention principles and other public health principles.

### Program Outcomes

At the end of the program, the young nephrologists will:

- a. Master the basic knowledge and clinical knowledge of the specialty in order to analyze the clinical situation, to propose a course of action and the appropriate treatment and be ready to act quickly in urgent cases.
- b. Acquire deep knowledge in other specialties (cardiology, internal medicine, etc.).
- c. Be able to take charge of a patient and provide moral and psychological support to the patient and entourage, especially those under chronic treatment (dialysis, renal transplant...).
- d. Be prepared to use new knowledge and new techniques to improve their practice.
- e. Master the gestures and techniques (renal biopsy, dialysis) proper to the specialty and apply them according to the rules of professionalism and ethics.
- f. Collaborate with other clinical or paraclinical specialists, respecting the principle of efficiency and in the best interest of the patient.
- g. Share their knowledge with peers, students and other healthcare professionals.
- h. Promote the principles of prevention and other public health principles (specific to their specialty without forgetting their skills as generalists).

## Diploma of Specialized Studies – Neurology (Hybrid<sup>i</sup>)

### Mission

The mission of our training program is to educate physicians who will be prepared at the end of their training to become leaders in the field of neurology as clinicians, teachers, researchers, and advocates.

### Program Educational Objectives

1. Graduates must use their basic and clinical knowledge acquired during the specialization path in order to support and treat the patient within the specialty, but without forgetting their skills in general practice.
2. Must support the patient psychologically and morally, and the family and entourage for better therapeutic compliance.
3. Must improve their knowledge and skills in parallel to the new technological discoveries and put them to the service of patients according to the rules of professionalism and ethics.
4. Have to practice their profession in accordance with the principles of quality, in particular the principles of efficiency and equity.
5. Must share their knowledge and promote prevention principles and other public health principles.

### Program Outcomes

At the end of the program, the young neurologists will:

- a. Master the basic knowledge and clinical knowledge of the specialty in order to analyze the clinical situation, to propose a course of action and the appropriate treatment and be ready to act quickly in urgent cases.
- b. Acquire deep knowledge in other specialties (internal medicine, ENT, ophthalmology, radiologist).
- c. Be able to take charge of a patient and provide moral and psychological support to the patient and entourage.
- d. Be prepared to use new knowledge and new techniques to improve their practice.
- e. Master the gestures and techniques (EEG, LP ...) proper to the specialty and apply them according to the rules of professionalism and ethics.

<sup>i</sup> Hybrid: Courses offered in French and/or English

- f. Collaborate with other clinical or paraclinical specialists, respecting the principle of efficiency and in the best interest of the patient.
- g. Share their knowledge with peers, students and other healthcare professionals.
- h. Promote the principles of prevention and other public health principles (specific to their specialty without forgetting their skills as generalists).

## Diploma of Specialized Studies – Neurosurgery (Hybrid<sup>i</sup>)

### Mission

The neurosurgery residency program is committed to training future leaders and innovators in academic neurological surgery by fostering the development of the cognitive, technical, academic, administrative and humanistic capabilities of our residents and training them to become highly motivated, confident, and clinically excellent specialists, equipped to contribute to the advancement of neurosurgery.

### Program Educational Objectives

1. Graduates must use their basic and clinical knowledge acquired during the specialization path in order to support and treat the patient within the specialty, but without forgetting their skills in general practice.
2. Must support the patient psychologically and morally, and the family and entourage for better therapeutic compliance.
3. Must improve their knowledge and skills in parallel to the new technological discoveries and put them to the service of patients according to the rules of professionalism and ethics.
4. Have to practice their profession in accordance with the principles of quality, in particular the principles of efficiency and equity.
5. Must share their knowledge and promote prevention principles and other public health principles.

### Program Outcomes

At the end of the program, the young neurosurgeons will:

<sup>i</sup> Hybrid: Courses offered in French and/or English

- a. Master the basic knowledge and clinical knowledge of the specialty in order to analyze the clinical situation, to propose a course of action and the appropriate treatment and be ready to act quickly in urgent cases.
- b. Acquire deep knowledge in other specialties (surgery, orthopedics, neurology, ENT, ophthalmology).
- c. Be able to take charge of a patient and provide moral and psychological support to the patient and entourage.
- d. Be prepared to use new knowledge and new techniques to improve their practice.
- e. Master the gestures and techniques proper to the specialty and apply them according to the rules of professionalism and ethics.
- f. Collaborate with other clinical or paraclinical specialists, respecting the principle of efficiency and in the best interest of the patient.
- g. Share their knowledge with peers, students and other healthcare professionals.
- h. Promote the principles of prevention and other public health principles.

## Diploma of Specialized Studies - Obstetrics and Gynecology (ob-gyn) (Hybrid<sup>i</sup>)

### Mission

The obstetrics and gynecology residency program will train physician leaders who provide innovative, compassionate, and comprehensive health care for women by caring about the health of mother and fetus and providing the latest innovation in the field in the respect of ethical principles and social beliefs.

### Program Educational Objectives

1. Graduates must use their basic and clinical knowledge acquired during the specialization path in order to support and treat the mother and fetus, and female diseases within the specialty, but without forgetting their skills in general practice.

<sup>i</sup> Hybrid: Courses offered in French and/or English

2. Must support the patient psychologically and morally, and the family and entourage for better therapeutic compliance.
3. Must improve their knowledge and skills in parallel to the new technological discoveries and put them to the service of patients according to the rules of professionalism and ethics.
4. Have to practice their profession in accordance with the principles of quality, in particular the principles of efficiency and equity.
5. Must share their knowledge and promote prevention principles and other public health principles.

### Program Outcomes

At the end of the program, the young ob-gyns will:

- a. Master the basic knowledge and clinical knowledge of the specialty in order to analyze the clinical situation, to propose a course of action and the appropriate treatment and be ready to act quickly in urgent cases.
- b. Acquire deep knowledge in other specialties (surgery, urology, endocrinology).
- c. Be able to take charge of a patient and or mother/fetus, and provide moral and psychological support to her and her entourage.
- d. Be prepared to use new knowledge and new techniques to improve their practice.
- e. Master the gestures and techniques (US, surgical, delivery, endoscopy) proper to their specialty and apply them according to the rules of professionalism and ethics.
- f. Collaborate with other clinical or paraclinical specialists, respecting the principle of efficiency and in the best interest of the patient.
- g. Share their knowledge with peers, students and other healthcare professionals.
- h. Promote the principles of prevention and other public health principles (specific to their prenatal diagnosis, STD, etc. without forgetting their skills as generalists).

## Diploma of Specialized Studies – Ophthalmology (Hybrid<sup>i</sup>)

### Mission

The mission of the ophthalmology residency program is to train future ophthalmologists in both clinical and academic ophthalmology. The residents' responsibilities have been meticulously structured to maximize the educational experience. This program will serve as a guideline for training centers enabling them to meet the Arab, European and American standards as set out by the different Boards.

### Program Educational Objectives

1. Graduates must use their basic and clinical knowledge acquired during the specialization path in order to support and treat the patient within the specialty, but without forgetting their skills in general practice.
2. Must support the patient psychologically and morally, and the family and entourage for better therapeutic compliance.
3. Must improve their knowledge and skills in parallel to the new technological discoveries and put them to the service of patients according to the rules of professionalism and ethics.
4. Have to practice their profession in accordance with the principles of quality, in particular the principles of efficiency and equity.
5. Must share their knowledge and promote prevention principles and other public health principles.

### Program Outcomes

At the end of the program, the young ophthalmologists will:

- a. Master the basic knowledge and clinical knowledge of the specialty in order to analyze the clinical situation, to propose a course of action and the appropriate treatment and be ready to act quickly in urgent cases.
- b. Acquire deep knowledge in other specialties, both medical and surgical, related to the specialty and their future practice.
- c. Be able to take charge of a patient and provide moral and psychological support to the patient and entourage.
- d. Be prepared to use new knowledge and new techniques to improve their practice.
- e. Master the gestures and techniques (diagnostic procedures, non-surgical management, and surgical management) proper to the specialty and apply them according to the rules of professionalism and ethics.
- f. Collaborate with other clinical or paraclinical specialists, respecting the principle of efficiency and in the best interest of the patient.
- g. Share his knowledge with his peers, students and other healthcare professionals.
- h. Promote the principles of (prevention) and other public health principles (specific to their specialty without forgetting their skills as generalists).

### Degree Requirements

## Diploma of Specialized Studies - Orthopedic Surgery and Traumatology (Hybrid<sup>i</sup>)

### Mission

The mission of the orthopedic surgery residency training program is to provide the trainees with the knowledge, clinical and surgical skills in all areas of orthopedic surgery necessary for either academic or private practice at the highest possible level of competence, and all of this in line with the highest standards of ethics towards patients and collaborators.

### Program Educational Objectives

1. Graduates must use their basic and clinical knowledge acquired during the specialization path in order to support and treat the patient within his specialty but without forgetting his skills in general practice.
2. Must support the patient psychologically and morally, and the family and entourage for better therapeutic compliance.
3. Must improve their knowledge and skills in parallel to the new technological discoveries and put them to the service of patients according to the rules of professionalism and ethics.
4. Have to practice their profession in accordance with the principles of quality, in particular the principles of efficiency and equity.
5. Must share their knowledge and promote prevention principles and other public health principles.

### Program Outcomes

At the end of the program, the young orthopedic surgeons will:

- a. Master the basic knowledge and clinical knowledge of the specialty in order to analyze the clinical situation, to propose a course of action and the appropriate treatment and be ready to act quickly in urgent cases.
- b. Acquire deep knowledge in other specialties (general surgery, vascular surgery and neurosurgery) in order to better perform their practice.
- c. Be able to take charge of a patient and provide moral and psychological support to the patient and entourage.
- d. Be prepared to use new knowledge and new techniques to improve their practice.
- e. Master the gestures and techniques proper to the specialty (tools, materials, surgery, cast) and apply them according to the rules of professionalism and ethics (to be defined).
- f. Collaborate with other clinical or paraclinical specialists, respecting the principle of efficiency and in the best interest of the patient.
- g. Share their knowledge with peers, students and other healthcare professionals.
- h. Promote the principles of prevention and other public health principles (specific to bones and joints) without forgetting their skills as generalists.

## Diploma of Specialized Studies – Pediatrics (Hybrid<sup>i</sup>)

### Mission

The pediatrics residency program mission provides residents with a broad exposure to the health care of children and substantial experience in the management of diverse pediatric pathologic conditions. Primary care, preventive health care, ethical issues, and discussions of the cost of diagnostic tests, procedures, and therapies are all a part of this program. Also, the program will introduce them to subspecialties of child medicine.

### Program Educational Objectives

1. Graduates must use their basic and clinical knowledge acquired during the specialization path in order to support and treat the patient within the specialty, but without forgetting their skills in general practice.
2. Must support the patient psychologically and morally, and the family and entourage for better therapeutic compliance.
3. Must improve their knowledge and skills in parallel to the new technological discoveries and put them to the service of patients according to the rules of professionalism and ethics.
4. Have to practice their profession in accordance with the principles of quality, in particular the principles of efficiency and equity.
5. Must share their knowledge and promote prevention principles and other public health principles.

### Program Outcomes

At the end of the program, the young pediatricians will:

- a. Master the basic knowledge and clinical knowledge of child medicine in order to analyze the clinical situation, to propose a course of action and the appropriate treatment and be ready to act quickly in urgent cases.
- b. Acquire knowledge in all pediatric specialties.
- c. Be able to take charge of a patient and provide moral and psychological support to the patient and entourage.
- d. Be prepared to use new knowledge and new techniques to improve their practice.

<sup>i</sup> Hybrid: Courses offered in French and/or English

- e. Master the gestures and techniques proper to the specialty and apply them according to the rules of professionalism and ethics.

### Diploma of Specialized Studies – Psychiatry (Hybrid<sup>i</sup>)

#### Mission

The mission of the psychiatry residency program is to promote the development of post-graduate psychiatrists who will be exceptional communicators, skillful psychotherapists, highly competent practitioners, and effective leaders. They will value lifelong learning, adhere to the highest ethical standards of the profession, and serve the community as role models.

#### Program Educational Objectives

1. Graduates must use their basic and clinical knowledge acquired during the specialization path in order to support and treat the patient within the specialty, but without forgetting their skills in general practice.
2. Must provide psychological support to the patient, and the family and entourage and empower social support for a better therapeutic response.
3. Must provide psycho-education to the patient, and the family and entourage in order to increase compliance to treatment and reduce relapses.
4. Must remain up to date and improve their knowledge and their skills in parallel to the new medical advances and put it to the service of patients according to the rules of professionalism and ethics.
5. Have to practice their profession in accordance with the principles of quality, in particular the principles of efficiency and equity.
6. Must share their knowledge and promote prevention principles and other public health principles.

#### Program Outcomes

At the end of the program, the young psychiatrists will:

- a. Master the basic knowledge and clinical knowledge of psychiatry in order to analyze the clinical situation, to propose a course of action and the appropriate treatment and be ready to act quickly in urgent cases (suicide, self-harm, harm to others...).
- b. Acquire deep knowledge in other specialties (especially in neurology).

<sup>i</sup> Hybrid: Courses offered in French and/or English

- c. Be able to take charge of a patient and provide moral and psychological support to the patient and entourage.
- d. Be prepared to remain up to date in their knowledge and use it to improve their practice.
- e. Master psychiatry and apply their knowledge according to the rules of professionalism and ethics.
- f. Collaborate with other clinical or paraclinical specialists, respecting the principle of efficiency and in the best interest of the patient.
- g. Share their knowledge with peers, students and other healthcare professionals.
- h. Promote the principles of prevention and other public health principles (specific to psychiatry without forgetting their skills as generalists).

### Diploma of Specialized Studies – Pulmonology (Hybrid<sup>i</sup>)

#### Mission

The mission of the pulmonology residency program is to educate MD graduates to evaluate and manage critically-ill patients requiring advanced pulmonology therapies, through a multidisciplinary team approach. They will be introduced to all subspecialties, in particularly intensive care and critical patient care.

#### Program Educational Objectives

1. The graduates must use their basic and clinical knowledge acquired during the specialization path in order to support and treat the patient within the specialty, but without forgetting their skills in general practice.
2. Must support the patient, psychologically and morally, and the family and entourage for better therapeutic compliance.
3. Must improve their knowledge and skills in parallel to the new technological discoveries and put them to the service of the patient according to the rules of professionalism and ethics.
4. Have to practice their profession in accordance with the principles of quality, in particular the principles of efficiency and equity.
5. Must share their knowledge and promote prevention principles and other public health principles.

<sup>i</sup> Hybrid: Courses offered in French and/or English

### Program Outcomes

At the end of the program, the young pulmonologists will:

- Master the basic knowledge and clinical knowledge in pulmonology in order to analyze the clinical situation, to propose a course of action and the appropriate treatment and be ready to act quickly upon urgent cases.
- Acquire deep knowledge in other specialties (cardiology, intensive care, ENT, etc.).
- Be able to take in charge of a patient and provide moral and psychological support to them and the entourage.
- Be prepared to use new knowledge and new techniques to improve their practice.
- Master the gestures and techniques (endoscopy) proper to the specialty and apply them according to the rules of professionalism and ethics.
- Collaborate with other clinical or para-clinical specialists, respecting the principle of efficiency and in the best interest of the patient.
- Share their knowledge with his peers, students and other healthcare professionals.
- Promote the principles of (prevention) and other public health principles (specific to pulmonology without forgetting their skills as generalists).

## Diploma of Specialized Studies - Pulmonary Diseases and Intensive Care Medicine (Hybrid<sup>i</sup>)

### Mission

The mission of the program is to educate physicians to become outstanding clinicians, teachers and scientists in the broad field of Pulmonary diseases and Intensive Care Medicine for the improvement of patient care and public health.

### Program Educational Objectives

#### A. Patient Care

<sup>i</sup> Hybrid: Courses offered in French and/or English

Fellows must be able to provide patient care that is compassionate, appropriate, and effective for the treatment of health problems and the promotion of health.

Fellows are expected to:

- A.1. Communicate effectively and demonstrate caring and respectful behaviors when interacting with patients and their families.
- A.2. Gather essential and accurate information about their patients.
- A.3. Make informed decisions about diagnostic and therapeutic interventions based on patient information and preferences, up-to-date scientific evidence, and clinical judgment.
- A.4. Develop and carry out patient management plans.
- A.5. Counsel and educate patients and their families.
- A.6. Use information technology to support patient care decisions and patient education.
- A.7. Perform competently all medical and invasive procedures considered essential for the area of practice.
- A.8. Provide health care services aimed at preventing health problems or maintaining health.
- A.9. Work with health care professionals, including those from other disciplines, to provide patient-focused care.

#### **B. Medical Knowledge**

Fellows must demonstrate knowledge about established and evolving biomedical, clinical, and cognate (e.g. epidemiological and social-behavioral) sciences and the application of this knowledge to patient care.

Fellows are expected to:

- B.1. Demonstrate an investigatory and analytic thinking approach to clinical situations.
- B.2. Know and apply the basic and clinically supportive sciences which are appropriate to their discipline.

#### **C. Practice-Based Learning & Improvement**

Fellows must be able to investigate and evaluate their patient care practices, appraise and assimilate scientific evidence, and improve their patient care practices.

Fellows are expected to:

- C.1. Analyze practice experience and perform practice-based improvement activities using a systematic methodology.
- C.2. Locate, appraise, and assimilate evidence from scientific studies related to their patients' health problems.
- C.3. Obtain and use information about their own population of patients and the larger population from which their patients are drawn.
- C.4. Apply knowledge of study designs and statistical methods to the appraisal of clinical studies and other information on diagnostic and therapeutic effectiveness.
- C.5. Use information technology to manage information, access on-line medical information; and support their own education.
- C.6. Facilitate the learning of students and other health care professionals.

#### **D. Interpersonal & Communication Skills**

Fellows must be able to demonstrate interpersonal and communication skills that result in effective information exchange and teaming with patients, their patients families, and professional associates.

Fellows are expected to:

- D.1. Create and sustain a therapeutic and ethically sound relationship with patients.
- D.2. Use effective listening skills and elicit and provide information using effective nonverbal, explanatory, questioning, and writing skills.
- D.3. Work effectively with others as a member or leader of a health care team or other professional group.

#### **E. Professionalism**

Fellows must demonstrate a commitment to carrying out professional responsibilities, adherence to ethical principles, and sensitivity to a diverse patient population.

Fellows are expected to:

- E.1. Demonstrate respect, compassion, and integrity; a responsiveness to the needs of patients and society that supersedes self-interest; accountability to patients, society, and the profession; and a commitment to excellence and on-going professional development.
- E.2. Demonstrate a commitment to ethical principles pertaining to provision or withholding of clinical care, confidentiality of patient information, informed consent and business practices.
- E.3. Demonstrate sensitivity and responsiveness to patients' culture, age, gender, and disabilities.

#### **F. Systems-Based Practice**

Fellows must demonstrate an awareness of and responsiveness to the larger context and system of health care and the ability to effectively call on system resources to provide care that is of optimal value.

Fellows are expected to:

- F.1. Understand how their patient care and other professional practices affect other health care professionals, the health care organization, and the larger society and how these elements of the system affect their own practice.
- F.2. Know how types of medical practice and delivery systems differ from one another, including methods of controlling health care costs and allocating resources.
- F.3. Practice cost-effective health care and resource allocation that does not compromise quality of care.
- F.4. Advocate for quality patient care and assist patients in dealing with system complexities.
- F.5. Know how to partner with health care managers and health care providers to assess, coordinate, and improve health care and know how these activities can affect system performance.

## Diploma of Specialized Studies – Radiology (Hybrid<sup>i</sup>)

### Mission

The mission of the diagnostic radiology residency program is to offer rich and diverse clinical experiences, a didactic curriculum, mentoring, and opportunities to train and educate residents to become experts in their field, skilled in their practice, excellent team workers and devoted teachers. X rays, ultrasounds, magnetic resonance and other technologies to come will transform them to the “eyes” of modern medicine.

The radiology program promotes the use of therapeutic skills in interventional radiology.

### Program Educational Objectives

1. Graduates must use their basic and clinical knowledge acquired during their pre-graduate and postgraduate path in order to diagnose and in some cases treat.
2. Must help colleagues for the best diagnosis and treatment of the patient.
3. Must improve their knowledge and skills in parallel to the new technological discoveries and put them to the service of patients according to the rules of professionalism and ethics.
4. Have to practice their profession in accordance with the principles of quality, in particular the principles of efficiency and equity.

### Program Outcomes

At the end of the program, the young radiologists will:

- a. Master the basic, clinical and technical knowledge in order to propose diagnosis.
- b. Acquire deep knowledge in other specialties (all).
- c. Be able to take charge of a patient and provide expertise in a team working for the best treatment.
- d. Be prepared to use new knowledge and new techniques to improve their practice.
- e. Master the gestures and techniques (diagnostic and treatment) proper to the specialty and apply them according to the rules of professionalism and ethics.
- f. Collaborate with other clinicians, respecting the principle of efficiency and in the best interest of the patient.
- g. Share their knowledge with peers, students and other healthcare professionals.

## Diploma of Specialized Studies – Urology (Hybrid<sup>i</sup>)

### Mission

The mission of the urology specialty program is to contribute to the improvement of the productivity of the medical community by providing experts trained with the information, procedural skills, professional attitudes and practical experience in the specialty.

### Program Educational Objectives

1. Graduates must use their basic and clinical knowledge acquired during the specialization path in order to support and treat the patient within the specialty, but without forgetting their skills in general practice.
2. Must support the patient psychologically and morally, and the family and entourage for better therapeutic compliance.
3. Must improve their knowledge and skills in parallel to the new technological discoveries and put them to the service of patients according to the rules of professionalism and ethics.
4. Have to practice their profession in accordance with the principles of quality, in particular the principles of efficiency and equity.
5. Must share their knowledge and promote prevention principles and other public health principles.

### Program Outcomes

At the end of the program, the young urologists will:

- a. Master the basic knowledge and clinical knowledge of the specialty in order to analyze the clinical situation, to propose a course of action and the appropriate treatment and be ready to act quickly in urgent cases.
- b. Acquire deep knowledge in other specialties (surgery, ob-gyn, nephrology).
- c. Be able to take charge of a patient and provide moral and psychological support to the patient and entourage.
- d. Be prepared to use new knowledge and new techniques to improve their practice.
- e. Master the gestures and techniques (endoscopic, manometric) proper to the specialty and apply them according to the rules of professionalism and ethics.
- f. Collaborate with other clinical or paraclinical specialists, respecting the principle of efficiency and in the best interest of the patient.
- g. Share their knowledge with peers, students and other healthcare professionals.
- h. Promote the principles of prevention and other public health principles (specific to their specialty without forgetting their skills as generalists).

| This course is based on an understanding of the different biochemical processes taking place in the human body. Students will learn about the basic formations in biochemistry, so they are then able to competently address all areas related to medical biochemistry. Structural biochemistry defines the structure of the various molecules of living matter such as carbohydrates, lipids, amino-acids, proteins, enzymes, nucleotides and vitamins.                                                                                                                                                                                                                                               |                                                       |              |
| <b>BCH421</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>Metabolic Biochemistry</b>                         | <b>3 cr.</b> |

| Understanding all vital processes requires knowledge of the biochemical reactions and their integration in metabolic pathways. This course covers two basic areas of molecular biochemistry which are the production and storage of energy, and the biosynthesis of macromolecules. The course starts with the metabolism of carbohydrates, the main producer of energy in the cell. Several topics are devoted to the study of glycogen metabolism, glycolysis, the Krebs cycle and the pentose phosphate pathway. Then lipid metabolism ( $\beta$ oxidation, fatty acid synthesis, cholesterol synthesis), and on to protein metabolism (transamination, urea cycle) and then nucleotide metabolism. |                                                       |              |

| This lab is divided into two parts: a biochemistry part and a molecular biology part. In the biochemistry sessions, the students are initiated into the methods used to measure the levels of lipids, proteins and carbohydrates in the serum of patients. In the second part of this lab, the students are introduced to molecular biology methods. They are allowed to practice most of the concepts covered in the course of molecular biology: genomic and DNA plasmid extractions, PCR amplification, enzyme digestion, SDS-PAGE, Western blot and bacterial transformation.                                                                                                                      |                                                       |              |

| The course begins with a review of nucleic acids and looks at the methods for their extraction, separation and analysis. Secondly, the course extensively studies the regulation of gene expression and provides an update on the changes to the nucleic acids transcriptionally, post-transcriptional and translational. Finally, detailed molecular analysis techniques, cloning, PCR, sequencing and development of DNA banks are described.                                                                                                                                                                                                                                                        |                                                       |              |

| The purpose of this course is to present a general outline on chemistry. Through this course chemistry is introduced in its various aspects: the structure of the atom, the various models, and the properties of the elements in the periodic table; various chemical bonds, the Lewis structure, VSEPR rules; thermochemistry, thermodynamics and chemical equilibrium; kinetic chemistry, reactions rate orders, the Arrhenius law; solutions chemistry, acids and bases and various acid-base equilibrium; complexation, liquid solid equilibrium and solubility product; and redox titration and electrochemical cells.                                                                           |                                                       |              |

| Organic chemistry is an introduction to the structure, reactivity, and properties of organic compounds. This course is intended to introduce students to the major concepts in organic chemistry and prepare them for the upper level classes in chemistry and biochemistry and the organic requirements for medical schools. Topics include: introduction and review, electronic structure and bonding in organic molecules; nomenclature of organic compounds; structure and properties of alkanes, cycloalkanes, and alkyl halides; stereoisomerism and chirality of organic compounds; and the structure, properties and reactivity of alkynes and alkenes.                                        |                                                       |              |

| In its chemistry parts the objective of the course is to introduce the students to the basic techniques used in a chemistry laboratory, including solution preparations, titration, distillation and recrystallization and aspirin synthesis. The physics part of this lab aims to achieve: the experimental measurement of the latent heat of vaporization at constant volume, the experimental study of the magnetic field, the operational amplifiers and the RLC circuit.                                                                                                                                                                                                                          |                                                       |              |
| <b>MAT216</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>General Mathematics</b>                            | <b>3 cr.</b> |
| This course provides the solid basics needed by students to be able to handle their specialty courses. Topics covered include: function of a real variable, elementary functions, Taylor's expansion, simple integral and methods of integration, differential equations, multivariable functions, continuity, partial derivative, the chain rule, differential, introduction to double integrals, methods of integration, matrix calculus, determinants, and linear systems.                                                                                                                                                                                                                          |                                                       |              |
| <b>MEDL200</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>Cytology and Human Cell Pathologies</b>            | <b>3 cr.</b> |
| This course aims to introduce concepts of molecular biology, cell biology, biochemistry, and genetic to medicine students. The topics include introduction to cell, organelles and cytoskeleton, DNA, membrane structure and transport, cell communication, cell cycle control, cell death, citric acid cycle, ATP production and electron transport/oxidative phosphorylation. In addition, the course will discuss the basis of the development of certain important diseases such as cancer, diabetes and mechanisms of therapeutic intervention.                                                                                                                                                   |                                                       |              |
| <b>MEDL205</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>General Histology</b>                              | <b>3 cr.</b> |
| The purpose of this course is the theoretical and practical acquisition of the fundamental basics in general functional histology. Outline: the histology techniques, supporting tissues, epithelial, muscle tissue, nerve tissue, hematopoietic tissue.<br>Methodology: theoretical acquisitions in lectures, tutorials and practical TD TP. Personal research work to strengthen and deepen these acquisitions. This course prepares the students for the understanding of the histology of organs.                                                                                                                                                                                                  |                                                       |              |
| <b>MEDL210</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>Musculoskeletal Anatomy</b>                        | <b>3 cr.</b> |
| The teaching of the anatomy of the musculoskeletal system has changed in recent years in the direction of simplification, a return to the essential, eliminating many unnecessary details. The program of the musculoskeletal system concerns the descriptive and topographic anatomy of the upper limbs and lower spine including the sacrum and the anatomy of the skull and rib cage.                                                                                                                                                                                                                                                                                                               |                                                       |              |
| <b>MEDL215</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>Biostatistics and Introduction to Epidemiology</b> | <b>3 cr.</b> |
| <b>Pre-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | MAT218 Or MAT216                                      |              |

This course introduces statistical information. It includes: information regarding how to organize and summarize data, how to reach decisions about a large body of data by examining only a small part of the data, the use of statistical data in medical literature and using frequently used statistical methods of data analysis.

**MEDL220 Human Anatomy 3 cr.**

This course introduces the students to the human body and its many complex structures. The structure and function of important organs will be demonstrated, discussed and related to common surgical scenarios and current research. Each part of the course will focus on a specific area of the human body. This will help the students to apply their understanding of basic anatomy to common clinical scenarios and research.

**MEDL300 Human Embryology 3 cr.**

This course helps the students understand how a well-organized and complete individual develops from the zygote (single totipotent) following inductions in chains. The aim is also to understand that the development of the human body is dependent on endogenous factors (regulatory genes) and is also dependent on external or environmental factors. This course is closely related to anatomy and also helps students to understand the anatomy of the adult.

**MEDL310 Human Cellular Physiology 3 cr.**

**Pre-requisites** BIO211 Or MEDL200

This class is a cellular human physiology course for students entering the medical professions. The students will study human cell functions and relate them to cell structure. Furthermore, this course involves the structure and function of the principal systems of the human body, as it pertains to how the body systems relate to one another in organization, adaptation, and homeostasis. While the course will focus on examining basic mechanisms in cell physiology, there will be a thread of discussion of disease mechanisms throughout preparing the students for the clinical physiology courses.

**MEDL315 Human Parasitology and Mycology 3 cr.**

Human parasitology and mycology involves the study of animals or fungal organisms that might be pathogenic to their host. The course will explore the importance of parasites and fungi, their biological classification and the diagnostic techniques used in their identification. Opportunistic diseases (such as toxoplasmosis, cryptococcal disease, and aspergillosis in the setting of HIV) will be of particular importance in this course. Furthermore, there will be a focus on tropical parasitic diseases that are common to our region and that require the ability to make a rapid diagnosis and initiate the appropriate specific treatment (as is the case with malaria and amebiasis). The course will include clinical cases that will be discussed to maximize the understanding and grasp of relevant content and ideas.

**MEDL320 Histology of Organs 3 cr.**

**Pre-requisites** SCS211 Or MEDL205

This course will familiarize the students with the structure of different organs in the human body. It will integrate the data learned in the general histology courses. Some physiological hints will be explained.

**MEDL321 Cytology and Histology Laboratory 1 cr.**

This course will initiate students into recognizing the histological structure of primary tissues in the human body. They will learn the basic functions of each tissue and the place it occupies in the organs. They will become aware of the importance of each structure for the good functioning of the organs.

**MEDL325 Physiology I 3 cr.**

**Pre-requisites** MEDL310 Or SCS325

The course is a complete review of the different systems in their normal and physiological situation. Neurology: the motor, somatosensory, vegetative reflexes, cortical, and vigilance states, emotions and fluid studies (CSF circulation) and metabolism. Endocrine: regulating the release and action of different hormones with clinical implications of their excesses and their disability. Gastric, intestinal and hepatic: general concepts, digestive, liver and biliary secretion, intestinal absorption, digestive motility and continence mechanism. The purpose of this course is to enable the students to thoroughly study the nervous, endocrine, gastric and hepatic systems functioning in normal conditions. It prepares students for the understanding of semiology (endocrine, neurology, gastric, hepatic) and their pathology.

**MEDL330 Homeostasis Physiology 3 cr.**

**Pre-requisites** MEDL310 Or SCS325

This course is given to medical students who have taken basic cell physiology and body anatomy. At this point of their training, the students will be introduced to the detailed functions of three major organs: the kidneys, the lungs and the heart. These three organs maintain the homeostasis of the body, namely the body fluid status, the acid/base balance, blood pressure, and gaseous exchanges.

**MEDL335 Biophysics 3 cr.**

**Pre-requisites** PHY210 And MAT218 Or MAT216

This course introduces the students to different types of radiation, explains their effects on the organism and defines the basic principles of radioprotection. It illustrates the physics of the different imaging modalities (XRy, US, CT, MRI, PET), their utility in clinical practice and their optimal usage. Molecular imaging enables visualization of the cellular function and the follow up of the molecular process in organisms by using biomarkers. It has numerous potentialities and helps diagnose cancer and neurological diseases.

**MEDL400 General Pathology 3 cr.**

**Pre-requisites** MEDL320 Or SCS320

The students will become aware of the lesions related to morbid processes and their morphological appearances in tissues. This will be carried out with some clinical, biological, physiopathological and epidemiological data. An overview of the different anatomo-pathological techniques will be provided.

**MEDL405 Immunology 3 cr.**

This class is a fundamental immunology course for students entering the medical professions. The students will study immune system physiopathology which is typically divided into two categories: innate and adaptive responses. This course includes the anatomy of central and peripheral lymphoid organs and functions of immune cells (T and B lymphocytes, NK cells, dendritic cells) and molecules (MHC, TCR, BCR, complement system) in physiological and pathological situations such as transplantation, infections, tumors and autoimmunity. The second part of the course provides the core information required to understand diseases with an immunological basis. It covers the underlying pathophysiology, the signs and symptoms of disease, the investigations required (mainly the immunologic laboratory tests intended to aid in clinical diagnosis). It also includes a brief review of immunohematology and blood transfusion issues.

**MEDL410 Microbiology 3 cr.**

The course will provide a foundation for the infectious diseases course. To achieve this the course has the following objectives to: understand the mechanisms by which pathogens cause infectious diseases at the environmental, molecular and cellular levels and the implications that these

mechanisms have on both treatment and prophylaxis; identify the main pathogenic bacteria, their epidemiology, the infections that they cause, as well as the notions of pathogen-specific antibiotic treatment and prophylaxis; explore the general laboratory techniques and methods used in the diagnosis of infections and in the identification of specific disease-causing pathogens.

**MEDL411 Parasitology and Microbiology Laboratory 1 cr.**

The experimental work supports the ideas explained in the course and introduces microbiological and experimental approaches. It includes bacteriological analysis of samples and a review of cyto-bacteriological bronchopulmonary secretions as well as blood culture. It deals with the cyto-bacteriological examination of urine and urethral smears.

**MEDL420 Surgical Semiology 3 cr.**

**Pre-requisites** SCS405 And SCS410 And SCS430 And SCS435 And SCS440 And SCS445 Or (MEDL325 And MEDL330)

This course discusses and explains the different signs and symptoms related to surgical pathologies as well as providing an introduction to how to take a medical history and do a physical exam.

**MEDL425 Epidemiology 3 cr.**

**Pre-requisites** STA220 Or MEDL215

This integrated course is a multi-disciplinary series of lectures and tutorials covering basic issues in epidemiology and biostatistics. The overall aim of this course is to familiarize students with concepts and measures of vital events, health, disease, disability and death. It also introduces students to epidemiologic methods related to identification of disease risk and protective factors, and to the assessment of causal associations and inferences. Special attention is given to presenting the contents in the context of the situation in Lebanon where possible. The statistical component of the course will present an overview of statistical estimation and hypothesis-testing procedures, and an introduction to relevant probability models.

**MEDL430 General Pharmacology and Toxicology 3 cr.**

**Pre-requisites** MEDL325 And MEDL330

The objective of this course is to familiarize the students with medications. It explains the different phases the medication has to go through before being manufactured and used on the market, the fate of medications in the body as well as the mechanism of action of the medications. The students will become familiar with major side effects of medications, drug-drug interactions and precautions to be taken while prescribing medications in specific populations.

**MEDL435 Medical Genetics 3 cr.**

The course will focus on human genetics: fundamental aspects, applications and methods. It will include principles of classical genetics and genomics, chromosomal studies, cyto-genetic and molecular approaches, genetic variations, population genetics and patterns of inheritance (monogenic, polygenic, and complex).

**MEDL445 Economics and Health Management 3 cr.**

This course is an introduction to theoretical health systems in the world giving students an insight into different economic, social and ethical aspects. The course covers principles of management focusing on hospital management.

**MEDL450 Medical Semiology 3 cr.**

The objectives of this course are to teach the students about the basics of physical exam, the signs and symptoms along with the associated biological and radiological signs related to the different syndromes and diseases in medicine.

**MEDL455 Emergency First Aid and Introduction to Hospital 1 cr.**

This course is for students entering the medical professions. This class is divided in two sessions: 1. Emergency first aid including CPR, first aid care of dislocation and neck fracture and back injuries, and bleeding emergencies; 2. Introduction to the different wards of a teaching hospital, and rotating in small groups to surgical and medical wards - ICU, pain, emergency, pediatrics requiring primary and essential skills.

**PHY210 General Physics 3 cr.**

The objective of this course is the introduction of various laws, principles and physical mechanisms, whose understanding is essential to students pursuing studies in various branches of science. This course consists of several independent parts. The first one deals with dynamics, the different types of motion, Newton's laws, and conservation of energy. The second part deals with hydrostatics and fluid dynamics. The third part deals with thermodynamics, calorimeters, the first principle and the basic transformations, the ideal gas, and thermodynamic cycles. The fourth part concerns the analysis of simple electrical circuits using Kirchhoff laws and the movement of a particle in an electromagnetic field. In the fifth part we talk about relativity, the theory of photons, and the photoelectric effect. Upon completion of this course the students will have acquired sufficient knowledge of several basic principles in physics and be familiar with these various topics.

**PSY201 Introduction to Psychology 3 cr.**

This course will provide students with the basic concepts in psychology and will facilitate their access to knowledge during their academic curriculum. It includes the following objectives: understanding psychology from a historical and a theoretical perspective (Gestalt, phenomenological, experimental, scientific, psychoanalytic and cognitive, etc.); understanding the various fields of psychology (clinical, experimental, developmental, educational, social, etc.) and the different methods used (experimental, clinical, psychometric, projective, etc.); providing an appropriate approach to personality issues - basic needs, affective and emotional (feelings, emotions), intellectual (cognition, memory) and social (social influence).

**SOC217 Citizen and Civic Engagement 2 cr.**

The course aims to teach USEK students notions, concepts and practical applications indicative of a civic and citizenship commitment which would contribute to the development of society.

This course is built on theoretical and practical learning areas as follows: a) Acquiring the concept of commitment and its forms (contract, charity work, activism, promise, voluntarism, giving, love of the other, etc.); b) Adopting the fundamental values of citizens such as: freedom of religion and expression, justice, equality, togetherness, family and social solidarity, patriotic and world collective identity, the place of religion in society, etc. .); c) Integrating the components of social life: democracy, laws, rights, civil society, communal life, social and community diversity, participation in political and public life, elections, individual, institutional and collective security, municipal activities, union activities, etc...) d) Addressing and dealing with social issues such as sustainable development, community health, social discrimination, work ethics, the integration of people with special needs, etc. (A description of performed observation and action is provided with the course, based on concepts covered in class).

**SRO217 Bioethics 3 cr.**

More and more, human beings have acquired power over nature due to sciences development and techniques. As a result of biology progress, he is trying to master health problems, reproduction and genetics. As for an essential question: Is all possible desirable?

This biological - techno - scientific upheaval which is causing an effective medicine meet another socio-cultural and ideological upheaval that has influenced the representations of life and death, health and sickness, care and preventive care, curative and palliative treatment... These changes are causing a huge social phenomenon that was materialized with bioethics term in 1971.

**MDG510 Clinical Pharmacology and Toxicology 3 cr.**

This course will cover all the major classes of medications. For each class of medications, the following subjects will be covered (including but not limited to): Therapeutic use of the class, mechanism of action, pharmacological properties, pharmacokinetics, side effects, drug-drug interactions, use of the medications in specific populations (Pregnancy, Lactation, Renal failure, liver failure...)

**MDG515 Electrocardiology and Hemodynamics 3 cr.**

This course covers multiple topics regarding dysfunction of the cardiovascular system, mainly in electrocardiology and cardiac mechanics. After a quick review of normal physiology, cardiac pathologies will be presented with a focus on recognized diseases, mainly those related to Dysrhythmias and Heart failure. The course is presented by cardiologists, cardiac anesthesiologist and cardiovascular surgeon, each of them has a different expertise in the field. Consequently, we expect that this course will give you a solid basis in the cardiovascular pathologies relevant to the course and prepare you adequately for the future therapeutics courses.

**MDG520 Cardiovascular Pathology 3 cr.**

This course covers the dysfunction of the cardiovascular systems. There will be a quick review of normal physiology, focus on cardiac pathology with all recognized diseases, mainly those most frequently encountered in clinical practice. This section 2 mainly focuses on Coronary artery diseases and Valvular diseases. This course will give you a solid foundation in cardiovascular pathology and prepare you for future therapeutics courses.

**MDG525 Pulmonary Pathology 3 cr.**

Following the acquisition of physiology, pathophysiology and clinical symptomatology, the course of medical and surgical lung diseases, coupled with clinical training and access to records of hospitalized patients, allows students to get to know the different lung diseases in their different aspects; clinical presentation, diagnosis, assessment, differential diagnosis and therapeutic approach that any general practitioner should know. This course focuses on various lung diseases; Infections, interstitial diseases, obstructive diseases, Asthma, neoplasm, vascular disease, pleural disease, respiratory distress...

**MDG530 Urinary Tract Pathology 3 cr.**

This is a urology-nephrology course that enables the students to study, diagnose and treat male and female urinary tract diseases, and the male reproductive system diseases. It familiarizes them to common urological problems including urinary obstruction, urinary incontinence, infections, and tumors of the urogenital tract...etc... It also teaches students nephrological pathologies to know the diagnosis and pathophysiology of renal diseases (tubular, glomerular, and vascular). Differentiate between acute and chronic renal failure. It allows the student to know the essential concepts of urology for future daily practice.

**MDG535 Endocrine and Metabolic Diseases 3 cr.**

This course aims to introduce, elaborate and explore diseases of the endocrine system and some of the frequent metabolic disorders to the medical student in order to help him achieving a good GP practice.

**MDG540 Specialized Anatomic Pathology 3 cr.**

This course will give the student the tools to diagnose lesions in different organs of the human body. It will let them recognize the abnormal appearance of the tissues in a given organ when subject to a pathological process.

**MDG545 Gastrointestinal Pathology 3 cr.**

This course covers medical and surgical diseases of the digestive tract. The development of the various chapters of the sessions will be supervised by recall and synthesis to make them easy to understand and enjoyable to browse. As in, students will learn flexibly a significant pathology for their medical education. At the end of the course, students will be able to acquire the basic knowledge of the discipline, to prepare successfully their medical degree and to adequately prepare testing and specialization contests.

**MDG550 Anatomic Pathology Laboratory 1 cr.**

These lab courses will put the students facing real tissue preparation and allow them to concretize what they have learned in the oral presentations they got in the anatomical pathology courses.

**MDG555 Hepatobiliary and Pancreatic Pathology 3 cr.**

This course treats the pathologies of the liver, biliary tract and pancreas. The courses will be shared between gastroenterologists and surgeons teachers. This course will aim to be complete and sufficient for students to acquire the basic knowledge necessary for their installation as general practitioners or specialists.

**MDG560 Obstetrics and Gynecology 3 cr.**

This course allows the student to recognize the various obstetrical and gynaecologic conditions beginning with normal delivery and ending with the different surgical gynaecologic pathologies. The content of this course is the following: normal delivery; its presentation, surveillance, complications... spontaneous abortions, vulvar and vaginal pathologies, uterine pathologies, ovarian and tubal pathologies, breast tumors, hemorrhages, infertility, hormonal problems; puberty, menstrual cycle, menopause.

**MDG565 Dermatology and Plastic Surgery 3 cr.**

At the end of this course the student, a future general practitioner, must be able to examine a patient suffering from dermatosis, to recognize the lesions and to describe them, and to be able to differentiate and diagnose the most frequent dermatological pathologies. The student must know how to recognize the surgical indications and appreciate the urgency of the treatment.

**MDG570 Pathology of the Musculoskeletal System 3 cr.**

The purpose of this course is to enable students to acquire notions of useful bases that any general practitioner should know, to be able to make diagnoses in everyday bone and joint diseases. The course includes concepts on pediatric orthopedics, notions on degenerative and infectious diseases and finally traumatology.

**MDG575 Psychopathology 3 cr.**

Modern psychiatry has expanded its focus to other areas than alienation, such as anxiety in all its forms, somatoform disorders, pain, psychoneurology, eating disorders, sexuality etc... It is estimated that around 25% of patients seen in general practice suffer from psychiatric symptoms or disorders. It is essential that (future) doctors receive more training in these newly recognized diseases that represent the quarter of their professional activity. Training in conventional psychiatry (such as schizophrenia) is no longer sufficient. The purpose of this course is to learn the basics in the diagnosis and treatment of the major psychiatric disorders found in child and adult psychiatry.

**MDG580 Neurological Diseases 3 cr.**

The purpose of this course is to deliver to the student a thorough knowledge of (surgical and medical) diseases of the nervous system, that are the most useful for a general practitioner because of their prevalence, their severity, the presence of possible therapeutic resources or their didactic interest. It will outline different disease processes and diagnostic procedure for each and allow the student to have hospital diagnostic and therapeutic responsibilities in decision-making procedures.

**MDG585 Ear, Nose, and Throat Pathology, and Ophthalmology 3 cr.**

This course will develop ENT pathology concerning the ear pathologies, and functional hearing disturbances, nose and sinuses diseases, oropharynx pathologies laryngeal and cervical, and facial pathologies in order to help the GP to treat the most frequent, to detect the most critical and follow up the most dangerous.

**MDG590 Oncology 3 cr.**

Hemato-Oncology course is divided into 2 parts: The part one is on solid tumour. The part two is on hematologic malignancies. The first session is an introduction to the course, followed by sessions on the carcinogenesis and principles of cancer's therapy than a detailed one on prevention and early detection. The other sessions are about oncologic emergencies, paraneoplastic syndromes and detailed sessions focused on the most prevalent and the most lethal cancer as well on those that shows some exemplarity. The second part describes the most common hematologic malignancies as well as those who need particular care as they are extremely dangerous.

**MDG595 Infectious Diseases 3 cr.**

The purpose of this course is to deliver to the student a thorough knowledge of different infectious diseases, which are the most useful for a general practitioner because of their prevalence, their severity, and the presence of possible therapeutic resources or their didactic interest. It will outline different disease processes and diagnostic procedure for each and allow the student to have hospital diagnostic and therapeutic responsibilities in decision-making procedures.

**MDG600 Pediatrics 3 cr.**

The objective of this course is to provide a rapid overview of common paediatric topics. This course implies much about the ability of the medical student to gather and analyze data and formulate a treatment plan. In addition, an overview of the most frequent surgical situations is analysed.

**MDG605 Autoimmune Inflammatory Rheumatic Diseases (AIIRD) 3 cr.**

The purpose of this course is to enable students to acquire notions of useful bases that any general practitioner should know, to be able to make diagnoses in everyday of the various rheumatic diseases most frequently observed in internal and general medicine to rapid diagnosis and plan a course of action therapeutic, educational and to refer to the specialist.

**MDG615 Hematology and Clinical Biology 3 cr.**

**Pre-requisites** SMG512

The first part of the Clinical Biology course, hematology, will discuss the basic concepts required to understand the physiology of blood cells, bone marrow and blood-forming organs, as well as, hemostasis. This understanding can then be used to properly interpret laboratory tests and make treatment and management plans. There will be a special emphasis on both the cytologic and immunophenotypic diagnostic aspect of hematological diseases. The second part of the course, clinical chemistry, will teach the foundations of clinical biochemistry that are necessary to understanding biochemical investigations. By using clinical cases as teaching material, the student will gain the knowledge and skills to make appropriate use of biochemical tests for the diagnosis and management of disease.

**MDG620 Public Health and Occupational medicine 3 cr.**

- Introduction to the doctor-patient relationship, doctor-hospital relationship, doctor-justice
- Lebanese Code of Medical Ethics
- Introduction to the three areas of medical law: medical liability, patient rights and bioethics
- Bioethics laws currently in force

**MDG625 Forensic Pathology and Medical Law 3 cr.**

This course is given in the form of 17 class sessions and 6 group work sessions. This course is equivalent to 3 credits. It aims to familiarize students (future practitioners) with public health and occupational medicine.

**MDG630 Introduction to Medical Research 3 cr.**

This integrated course is a series of lectures and tutorials covering fundamental concepts and basic analytic methods pertaining to the design, analysis, and interpretation of clinical research studies. It will prepare students to medical thesis concepts as well as clinical research organization.

**MDG635 Medical and Surgical Therapeutics Seminars I 3 cr.**

**Pre-requisites** SMG513

The course assembles in two parts a broad spectrum of pathologies (the more frequent in daily practice of a general practitioner) in medical and surgical areas and helps the students to assess frequent and urgent situations in matters of diagnosis and therapeutics.

**MDG640 Medical and Surgical Critical Care 3 cr.**

**Pre-requisites** SMG513

The aim of the course is to prepare future generalists for airway techniques, CPR techniques, analgesic techniques and other critical care and anesthesia skills to use in critical situations for their patients.

**MDG645 Clinical Reasoning and Risk Management 3 cr.**

This course describes and elaborates on the process of reasoning facing a clinical situation, dealing with the best use of the knowledge gained by the students through the learning process considering above all the safety of the patient, of the team and finally themselves.

The course will be divided into 3 parts: (1) The reasoning process (2) The risk management (3) The ethical problems, with clinical examples concerning in particular organ transplantation.

**MDG650 Medical and Surgical Therapeutics Seminars II 3 cr.**

**Pre-requisites** SMG513

The course assembles in two parts a broad spectrum of pathologies (the more frequent in daily practice of a general practitioner) in medical and surgical areas and helps the students to assess frequent and urgent situations in matters of diagnosis and therapeutics.

**SIN240 Introduction to Nursing Sciences 3 cr.**

This course aims at teaching current medical vocabulary. It introduces students to the history of the profession and the various concepts and theories of nursing. It is a theoretical course on basic nursing care: hygiene, comfort and vital parameters. Furthermore, the students are introduced to the study of the basic needs of human beings according to influential nurse, researcher, theorist and author, Virginia Henderson, in addition to the care process and handling the nursing care file. It concludes with an exploration of professional ethics through brainstorming.

**SIN242 Human Anatomy and Physiology 3 cr.**

This course provides a general overview of the human anatomy and the organization of the various human body systems. It introduces the basics of the normal functioning of an organ, starting with the structural and functional unit that is the cell and ending with the most organized systems and the links among them. Students will become acquainted with these essential key concepts, and will learn to master them, as they are essential for the assimilation and understanding of the pathophysiology and pathology.

**SIN243 Basic Nursing Care 3 cr.**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                         |              |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------|--------------|
| <b>Pre-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | SIN240                                                  |              |
| The course teaches basic knowledge about child health from birth to adolescence and the description of associated nursing health care, in particular prevention and detection of pathologies and specific risks from the stages of early childhood to adolescence. This theoretical course covers the basics of nursing competencies, known as "cross-sectional care". Students will deepen their knowledge of the nursing care process with an introduction to the concept of nursing diagnosis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                         |              |
| <b>SIN245</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>Clinical Training and First Aid</b>                  | <b>3 cr.</b> |
| This course familiarizes students with the basic knowledge of the functioning of the various systems of the body and their main diseases. In addition, awareness of accident prevention, infectious diseases and those related to current lifestyle (sedentary lifestyle, poor eating habits, etc.), prevention and cancer screening will be covered. This is a practical course where students will learn through activities; they will be taught how to conduct first aid practices, including all the steps to follow when facing life-threatening emergencies or accidents (a first aid certificate is delivered by the Lebanese Red Cross).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                         |              |
| <b>SIN246</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>Elderly Nursing Care</b>                             | <b>3 cr.</b> |
| This course explores the role of the elderly in society, the aging physiology and psychological difficulties facing the multiple losses due to old age. Specific diseases and pathologies of the elderly will be examined and the associated nursing and basic care will be taught.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                         |              |

| Internships are where students learn and practice basic nursing care procedures in a hospital setting, including hygiene care, comfort of the patient, and monitoring of vital parameters. This internship experience will introduce students to the structure and organization of a hospital, the role of each member of the team, the opportunity to observe patient care procedures in hospital wards, and practical experience in basic care and hygiene monitoring as studied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                         |              |

| This internship focuses on the observation and participation by students in providing care to preschool and school children, adolescents and the elderly in daycare centers, schools and hospices. Observation and implementation of the healthcare and basic nursing care procedure as studied and demonstrated during the course will be put into practice, which will provide students with essential practical experience.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                         |              |
| <b>SIN270</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>Clinical Internships (Summer)</b>                    | <b>1 cr.</b> |
| Students will participate in two full-time internships to gain experience in the implementation and enhancement of basic theoretical knowledge and skills studied during the first two semesters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                         |              |
| <b>SIN323</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>Public and Community Health and Nursing Care</b>     | <b>3 cr.</b> |
| This course introduces students to the elements that influence health, helps them to identify information resources that allow and facilitate the knowledge of a community, and to practice nursing in different community health and public health environments with different clientele living with particular health problems.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                         |              |

| The pharmacology course includes theoretical teaching and bibliographic research. The theoretical training consists of two parts: general and specific pharmacology. The first part is based on the fundamental concepts in pharmacology, and the second part talks about the drugs used for diseases of different systems. This second part introduces the therapeutic classes, the most frequently prescribed drugs, and the more recent drugs on the market. It also provides practical remarks and notes, and preventive measures, while focusing on the profession of nursing in particular, for a better and easier practice in situ. Regarding the practical part, students will choose a topic they would like to deal with among a series of suggested topics. Then, students will be asked to prepare a written report, followed by a short oral presentation about their research topic, allowing all students to benefit from all subjects discussed. This course is specifically designed for nursing students, as it provides them with the essential concepts and practical recommendations that will be important for them later on in the workplace. The toxicology course covers all acute situations and cases of toxic origin that an ER doctor or nurse may face. The groups of the most important toxic substances seen are studied as well as medicines, drugs, corrosives, and chemical weapons, etc. |                                                         |              |

| This course acquaints students with the prevailing exemplary pathologies, and the most urgent and serious neonatal cases, emergency infant, young child and adolescent cases and situations, as well as the various methods of preventing these diseases. It also describes the most common pediatric syndromes or diseases requiring surgical treatment. Students will acquire the theoretical knowledge needed for the care and supervision of a child in a neonatal period, in the hospital and in society. This useful knowledge is essential for any nursing student wishing to be a health promoting agent within the community.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                         |              |

| In this course students will revisit in detail the physiological anatomy of the respiratory tract system, including the main pathologies of pneumology and nursing care associated with the diagnosis, and the medical treatment and surgical management of these diseases. The role of nurses combating the health consequences, prevention, and cessation of smoking is also a focus subject tackled on this course.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                         |              |

| This course offers a clinical and para-clinical description of the various endocrine syndromes, their treatment and the role of the nurse with patients showing these symptoms. The course describes also the various endocrine pathologies requiring surgery, detailing the medical indications, surgical techniques, complications to be faced and the role of the nurse with patients. It also introduces them to the nutrition and nutritional strategies in situations of abuse and various pathologies that may benefit from nutritional care, such as diabetes, kidney disease, dyslipidemia, obesity and cardiovascular disease.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                         |              |

| The nursing care part of the course revisits the physiological anatomy of the cardiovascular system, a description of the main diseases in cardiology and the nursing care responsibilities related to the diagnosis, as well as the medical treatment and surgical management of these diseases. The cardiac surgery part of the course covers the main surgery procedures of the heart and thoracic aorta, detailing surgical pathologies, the principle of procedure as well as the major surgical complications and their treatment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                         |              |

| This course provides an understanding of the basics of physiopathology and an assimilation of the basic concepts of the various digestive and liver diseases and their consequences, in order to design and manage the care of patients. It accurately describes the nursing care of patients with digestive diseases.                                                                                                                                                                                                                                                                                                                      |                                                                 |              |

| This course teaches students about the elementary physiopathology of the sense organs and how to assimilate the fundamentals of the various eye, ENT sphere, and skin diseases and their consequences, in order to design and manage the treatments and care for patients without any complications. Learning about the prevention measures, the application of the nursing care process and the establishment of the nursing diagnoses are fundamental to this course.                                                                                                                                                                     |                                                                 |              |

| This internship will facilitate the development of knowledge and theoretical/practical skills in relation to nursing care, clinical assessment in the nursing field, the organization of care and the patient/care provider relationship. Knowledge acquisition in this internship is preferably centered on the teaching of diseases and nursing care, which is provided in parallel during the course.                                                                                                                                                                                                                                    |                                                                 |              |

| The first part of the course covers general information about pregnancy and possible nursing interventions for patients in the delivery room and postpartum. The second part provides an understanding of the basics of the different pathologies in gynecology in order to oversee the care of patients and avoid any complications. In both parts, learning preventive measures, applying nursing care processes and the establishing nursing diagnoses are essential knowledge and skills to acquire.                                                                                                                                    |                                                                 |              |

| This course covers infectious disease mechanisms including ecological, molecular and cellular, and the implications of these mechanisms for the treatment and prophylaxis. The focus will be on the integration of basic concepts of antibiotic treatment and specific prophylaxis and general methods of diagnosing bacterial infections and pathogens requiring technical methods. Students will study the most common infectious diseases, treatments, prevention methods and the specific nurse responsibilities for these pathologies, along with a study of nosocomial infections and the role of the nurse (AD) in their prevention. |                                                                 |              |

| This course is designed to provide students with the necessary information to understand the various benign and malignant hematological diseases, and cancer diseases. The various parts of the course allow students to understand the basic mechanisms of disease formation and help them adopt the related treatments. It accurately describes the nursing care procedures for patients with hematological disorders and cancerous diseases.                                                                                                                                                                                             |                                                                 |              |

| This course helps students understand and assimilate the basic concepts of the different pathologies in intensive care units and their consequences, in order to design and manage the type of care required for patients in critical conditions. It describes in detail the nursing care procedures to be given to critically-ill patients.                                                                                                                                                                                                                                                                                                |                                                                 |              |

During their internship, the students must be able to integrate all their knowledge in semiology and pathology in order to: interrogate the patient and family regarding the patient's medical history; perform a complete and thorough clinical examination; write a good medical observation based on the collection of data and the clinical examination; respect the rules of ethics and deontology.

**SMG511 Hospital Training I 1 cr.**

**Pre-requisites** SMG510

During internship, the students must be able to recall all their knowledge in semiology and pathology in order to gain skills to: interrogate the patient and the family regarding the patient's medical history; perform a complete and thorough clinical examination; write a good medical observation based on the collection of data and the clinical examination; develop diagnostic hypotheses and discuss them with the residents and the attending physicians; and respect ethics and deontology.

**SMG512 Hospital Training II 3 cr.**

**Pre-requisites** SMG511

During internship, the students must be able to recall all their knowledge in semiology and pathology in order to gain skills to: interrogate the patient and the family regarding the patient's medical history; perform a complete and thorough clinical examination; write a good medical observation based on the collection of data and the clinical examination; develop diagnostic hypotheses and discuss them with the residents and the attending physicians; and respect ethics and deontology.

**SMG513 Hospital Training III 3 cr.**

**Pre-requisites** SMG512

During the internship, the students must be able to recall all their knowledge in semiology and pathology in order to gain skills to: interrogate the patient and the family regarding the patient's medical history; perform a complete and thorough clinical examination; write a good medical observation based on the collection of data and the clinical examination; develop diagnostic hypotheses and discuss them with the residents and the attending physicians; elaborate a tailored plan of investigations based on a clear structure; and respect ethics and deontology.

**SMG514 Hospital Training IV 3 cr.**

**Pre-requisites** SMG513

During the internship, the students must be able to recall all their knowledge in semiology and pathology in order to gain skills to: interrogate the patient and the family regarding the patient's medical history; perform a complete and thorough clinical examination; write a good medical observation based on the collection of data and the clinical examination; develop diagnostic hypotheses and discuss them with the residents and the attending physicians; elaborate a tailored plan of investigations based on a clear structure; and respect ethics and deontology.

**SMG515 Hospital Training V 3 cr.**

**Pre-requisites** SMG514

During the internship, the students must be able to recall all their knowledge in semiology and pathology in order to gain skills to: interrogate the patient and the family regarding the patient's medical history; perform a complete and thorough clinical examination; write a good medical observation based on the collection of data and the clinical examination; develop diagnostic hypotheses and discuss them with the residents and the attending physicians; elaborate a tailored plan of investigations based on a clear structure; and respect ethics and deontology.

**SMG516 Hospital Training VI 1 cr.**

**Pre-requisites** SMG515

During the internship, the students must be able to recall all their knowledge in semiology and pathology in order to gain skills to: interrogate the patient and the family regarding the patient's medical history; perform a complete and thorough clinical examination; write a good medical observation based on the collection of data and the clinical examination; develop diagnostic hypotheses and discuss them with the residents and the attending physicians; elaborate a tailored plan of investigations based on a clear structure; and respect ethics and deontology.

**SMG517 Hospital Training VII 3 cr.**

**Pre-requisites** SMG516

During the internship, the students must be able to recall all their knowledge in semiology and pathology in order to gain skills to: interrogate the patient and the family regarding the patient's medical history; perform a complete and thorough clinical examination; write a good medical observation based on the collection of data and the clinical examination; develop diagnostic hypotheses and discuss them with the residents and the attending physicians; elaborate a tailored plan of investigations based on a clear structure; and respect ethics and deontology.

**SMG518 Hospital Training VIII 3 cr.**

**Pre-requisites** SMG516

During the internship, the students must be able to recall all their knowledge in semiology and pathology in order to gain skills to: interrogate the patient and the family regarding the patient's medical history; perform a complete and thorough clinical examination; write a good medical observation based on the collection of data and the clinical examination; develop diagnostic hypotheses and discuss them with the residents and the attending physicians; elaborate a tailored plan of investigations based on a clear structure; and respect ethics and deontology.

**SMG519 Hospital Training IX 3 cr.**

**Pre-requisites** SMG517

During the internship, the students must be able to recall all their knowledge in semiology and pathology in order to gain skills to: interrogate the patient and the family regarding the patient's medical history; perform a complete and thorough clinical examination; write a good medical observation based on the collection of data and the clinical examination; develop diagnostic hypotheses and discuss them with the residents and the attending physicians; elaborate a tailored plan of investigations based on a clear structure; and respect ethics and deontology.

**SMG520 Hospital Training X 3 cr.**

During the internship, the students must be able to recall all their knowledge in semiology and pathology in order to gain skills to: interrogate the patient and the family regarding the patient's medical history; perform a complete and thorough clinical examination; write a good medical observation based on the collection of data and the clinical examination; develop diagnostic hypotheses and discuss them with the residents and the attending physicians; elaborate a tailored plan of investigations based on a clear structure; and respect ethics and deontology.

**TMG697A Thesis of Medicine 9 cr.**

**Pre-requisites** SMG517

The medical students are asked for a thesis which is intended to deliver basic principles that form the foundation for scientific investigation and prepare students with the fundamentals for development of research. They will use, under the supervision of their tutors, a clinical research method, and research the literature and public information in support of their work, to provide a written document to be discussed in front of a jury.

**MEDR901 Surgical Anatomy 3 cr.**

This course deals with the knowledge of applied anatomy according to different surgical approaches. It teaches residents how to evaluate the anatomical and surgical risk of different approaches and master the urgent actions to be performed using anatomical knowledge.

**MEDR902 Pediatric Emergencies 3 cr.**

This course gives students a clear indication of what they need to prioritize. It provides an educational road map. At the end of this course, the learners should be able to manage all situations in the emergency room, like interpreting a standardized ECG, and list a differential diagnosis to all essential pathologies received in ED. This course is more practical than theoretical. It is a process of collecting, synthesizing, and interpreting information to aid decision-making.

**MEDR903 Semiology in Radiology 3 cr.**

The course enables residents to identify, understand and interpret radiologic signs in different pathologies.

**MEDR904 Principles of Anesthesia and Critical Care Medicine 3 cr.**

This course is given to the residents in anesthesiology as an introduction and an upgrading of their basic knowledge in anesthesia to all future specialists in this field.

**MEDR906 Trauma 3 cr.**

This course allows residents to understand and evaluate traumatic emergencies and classify clinical syndromes. They become familiar with the study of the circumstances and the know-how to establish a diagnostic approach. They learn to master the urgent actions to be executed and chart the course of action and ensure medical care.

**MEDR907 Anesthesia according to the Surgical/Medical Procedure 3 cr.**

This course aims to prove that, independently of the patient status and medical background, anesthesia can differ according to the intervention (procedure) to be carried out.

**MEDR908 Anesthesia according to the Status and Medical background of the Patient 3 cr.**

This course aims to prove that, independently of the intervention (procedure) to do, anesthesia can differ according to the patient status and medical background.

**MEDR909 Anesthesia in Children, Shocks and Aggressions 3 cr.**

This course is an upgrading in special areas and subspecialties in particular in pediatric patients. Also, critical care situations and aggressions will be discussed extensively.

**MEDR910 Medical Emergencies 3 cr.**

This course helps residents recognize urgent situations requiring immediate intervention. It describes an appropriate diagnostic approach and teaches them to apply the basic principles of management with proper prioritization of solving problems and taking actions.

**MEDR911 Non-trauma Urgent Surgical Situations 3 cr.**

This course allows residents to understand and evaluate non traumatic emergencies and classify clinical syndromes. Residents study the circumstances and the know-how to establish a diagnostic approach. They learn how to master the urgent actions to be executed and chart the course of action and ensure medical care.

**MEDR912 Pediatric and Neonatal Resuscitation 3 cr.**

This course is an educational program that introduces the concepts and basic skills of pediatric and neonatal resuscitation. By completing this course, the teachers are responsible for determining the level of competence and qualifications required for residents to assume clinical responsibility for resuscitation cases in hospital.

**MEDR913 Basic Principles in Pediatrics 3 cr.**

This course is essential to check that residents have acquired the basics during their M.D. and to guide them to the specific resources of their specialty. It will lead them to understand the challenges faced by children living in resource-poor settings.

**MEDR914 General Pediatrics Guidelines 3 cr.**

The guidelines are developed by the AAP in response to the lack of standardized guidelines for international health training in pediatric residencies. Residents are encouraged to utilize and adapt these guidelines to assess their progress in meeting the objectives of their training.

**MEDR916 Surgical Methodology 3 cr.**

This course allows residents to understand the basic principles of surgery. They learn how to support a patient pre- and post-operatively. They learn how to guarantee the follow up of procedures and manage complications and know the latest updates in surgery.

**MEDR918 Principals in ENT 3 cr.**

During the first year, courses are held for the residents in the basic sciences of Ear, Nose and Throat (ENT) (such as embryology, anatomy and physiology of the ENT and head and neck), at the Eye & Ear Hospital.

**MEDR919 Surgical Anatomy in ENT 3 cr.**

This course will cover a large number of the ENT diseases which are found in the pediatric population. It will also deal with surgical anatomy aspects related to ENT.

**MEDR920 Semiology and Pathology of the Ear, the Nose and the Sinuses 3 cr.**

This course will cover the special ENT diseases which are diseases of the regions of the nose and the ear. The course will also develop the techniques to explore these special regions.

**MEDR921 Semiology and Pathology of the Head and Neck 3 cr.**

This course will cover the head and neck pathology which includes diseases, injuries and malformations.

**MEDR922 Anatomy and Embryology and Physiology of the Eye 3 cr.**

During the first year, courses are held for the residents in the basic sciences of ophthalmology (such as embryology, anatomy and physiology of ocular structures) at the Eye & Ear Hospital.

**MEDR923 Ophthalmic Investigation Methods, Surgical Methodology in Ophthalmology and External Ocular Pathologies 3 cr.**

This academic credit is held all year long, the courses being given at the Eye & Ear department in the form of clinical cases and/or presentations which may be prepared by the residents themselves in the presence of attending physicians who may discuss specific cases with residents. Emphasis is placed on methods of examination in ophthalmology.

**MEDR924 Anterior Segment Pathologies 3 cr.**

This covers anterior segment pathologies, diseases of the orbit, pediatric ophthalmology and neuro-ophthalmology.

**MEDR925 Posterior Segment Pathologies and Neuro-ophthalmology 3 cr.**

This covers posterior segment pathologies, diseases of the orbit, pediatric ophthalmology and neuro-ophthalmology.

**MEDR926 Medical Pathologies I 3 cr.**

This course helps residents master their knowledge in physiology, clinical findings, diagnosis and differential diagnosis, investigations and treatment of frequent diseases in cardiology, gastro-intestinal medicine, and hematology (benign and malignant).

**MEDR927 Medical Pathologies II 3 cr.**

This course helps residents master their knowledge in physiology, clinical findings, diagnosis and differential diagnosis, investigations and treatment of frequent diseases in pneumology, neurology, oncology and dermatology.

**MEDR928 Medical Pathologies III 3 cr.**

This course helps residents master their knowledge in physiology, clinical findings, diagnosis and differential diagnosis, investigations and treatment of frequent diseases in internal medicine, rheumatology, endocrinology, infectious diseases, nephrology and dermatology.

**MEDR929 Cellular and Histological Physiology 3 cr.**

This course aims to upgrade the basic knowledge about cell and tissue physiology in order to understand the morphology and the pathological transformations.

**MEDR930 Morbid Processes 3 cr.**

This course aims to upgrade the basic knowledge of the morbid processes at the microscopic level to understand more about pathophysiology and diseases.

**MEDR930A-B-C-D Seminars and Conferences 12 cr.**

Seminars and conferences represent both a learning and assessment tool knowing that the theoretical education of the resident remains mostly a personal work that begins with reading books and articles, preparing conferences and is ongoing with continuing medical education and self-learning (erudition). During development, the "apprentice doctors" must initially attend and listen to their elders, then submit records to the staff, then present lectures to peers and seniors locally (hospital) and in a local congress and finally in an international congress. In parallel and concerning teaching, it begins with clinical teaching to the youngest and finishes during university courses.

**MEDR931 Pathology of Organs and Systems 3 cr.**

This course discusses the pathology of all organs and systems on the microscopic and macroscopic levels.

**MEDR932 Pathology of the Skin, the Central Nervous System and Soft Tissue System 3 cr.**

This course discusses the pathology of the skin, the central nervous system and soft tissue system on the microscopic and macroscopic levels.

**MEDR933 Psychiatric Pathologies I 3 cr.**

Psychiatry is the branch of medicine concerned with the bio-psycho-social study of the etiology, assessment, diagnosis, treatment and prevention of mental, emotional and behavioral disorders, alone or as they coexist with other medical or surgical disorders across the life span. Upon completion of training, the residents are expected to be competent specialists in psychiatry. Residents must demonstrate the requisite knowledge, skills and attitudes for effective patient-centered care and service to a diverse population across the life span. The residents must acquire a working knowledge of the theoretical basis of psychiatry, including its foundations in the basic medical sciences and research. In all aspects of specialist practice, the residents must be able to address issues of gender, sexual orientation, age, culture, ethnicity and ethics in a professional manner.

**MEDR934 Psychiatric Pathologies II 3 cr.**

Psychiatry is the branch of medicine concerned with the bio-psycho-social study of the etiology, assessment, diagnosis, treatment and prevention of mental, emotional and behavioral disorders, alone or as they coexist with other medical or surgical disorders across the life span. Upon completion of training, the residents are expected to be competent specialists in psychiatry. Residents must demonstrate the requisite knowledge, skills and attitudes for effective patient-centered care and service to a diverse population across the life span. The residents must acquire a working knowledge of the theoretical basis of psychiatry, including its foundations in the basic medical sciences and research. In all aspects of specialist practice, the resident must be able to address issues of gender, sexual orientation, age, culture, ethnicity and ethics in a professional manner.

**MEDR937 Medical Microbiology 3 cr.**

The medical microbiology course aims to: understand the collection, transport and processing of different microbiological samples; explore the general laboratory techniques and methods used in the diagnosis of infections and in the identification of specific disease-causing micro-organisms; survey the main pathogens in bacteriology, virology, parasitology and mycology - their epidemiology, the clinical infections that they cause as well as treatment and prophylaxis.

**MEDR938 Medical Biochemistry 3 cr.**

This course will explore the theoretical principles, interferences and clinical interpretation of the different tests that are performed in clinical chemistry. Furthermore, residents will learn the mechanisms, proper methods of operation, maintenance and quality control of the lab equipment used to measure various chemical parameters.

**MEDR939 Clinical Hematology 3 cr.**

The clinical hematology course will teach the students the theory of hematology, lab techniques in hematology and the proper extension of hematology lab investigations to the clinical setting.

**MEDR940A-B-C-D Internship Residency I 24 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR941A-B-C-D Residency Rotation in Surgery 24 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR946 Polyvalent Clinical Pathology 3 cr.**

This course will explore quality control, management and administrative issues related to laboratory functioning. The students will also deepen previously acquired knowledge in clinical microbiology, clinical chemistry and clinical hematology.

**MEDR947A-B-C-D-E-F-G-H Residency Rotation in Orthopedics 48 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR948A-B-C-D-E-F-G-H Residency Rotation in Urology 48 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR949A-B-C-D-E-F      Residency Rotation in General Surgery      36 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR950A-B-C-D-E-F-G-H      Residency Rotation in Neurosurgery      48 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR951A-B-C-D-E-F-G-H-I-J      Residency Rotation in Cardiovascular and Thoracic Surgery      60 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR952A-B-C-D-E-F      Residency Rotation in Gynecology      36 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR953A-B-C-D      Residency Rotation in Internal Medicine      24 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR954A-B-C-D-E-F      Residency Rotation in Cardiology      36 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR955A-B-C-D      Residency Rotation in Pulmonology      24 cr.**

During the residency, the students must be able to integrate all their knowledge in physiology, pathophysiology, semiology and pathology in order to interrogate the patient and family regarding the patient's active and past medical history; perform a complete and thorough clinical examination; write a good medical observation based on the collection of data and the clinical examination; develop diagnostic hypotheses and discuss them with the other residents and the attending physicians; elaborate a tailored plan of investigations and treatment based on a clear structure and common sense and respect of ethics and deontology.

**MEDR955E-F-G-H      Residency rotation in Pulmonary diseases and Intensive Care Medicine      24 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR956A-B-C-D-E-F      Internship Residency in Neurology      36 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR957A-B-C-D-E-F-G-H      Residency Rotation in Hematology-Oncology      48 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR958A-B-C-D-E-F      Residency Rotation in Gastroenterology      36 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR959A-B-C-D-E-F      Internship Residency Nephrology      36 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR960A-B-C-D-E-F-G-H-I-J      Residency Rotation in Anesthesia      60 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical

skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR961A-B-C-D-E-F-G-H      Residency Rotation in Pediatrics      48 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR962A-B-C-D-E-F-G-H      Residency Rotation in Radiology      48 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR963A-B-C-D-E-F      Residency Rotation in ENT      36 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR964A-B-C-D-E-F-G-H      Residency Rotation in Ophthalmology      48 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR965A-B-C-D      Residency Rotation in Emergency Medicine      24 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR966A-B-C-D-E-F-G-H      Residency Rotation in Pathology      48 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR967A-B-C-D-E-F-G-H      Residency Rotation in Psychiatry      48 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR968A-B-C-D      Residency Rotation in Dermatology      24 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR969A-B-C-D-E-F-G-H      Residency Rotation in Clinical Biology      48 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR970A-B-C-D-E-F      Residency Rotation in Endocrinology and Metabolic Disorders      36 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

**MEDR971A-B-C-D-E-F      Residency Rotation in Infectious Diseases      36 cr.**

The core curriculum is the phase in which residents will acquire all the basic theoretical knowledge of their specialty as well as multidisciplinary expertise in relation to the specialty. During this phase, residents improve basic clinical skills (diagnostic, medical strategy and treatment), improve their technical skills in the specialty, their organizational skills, their communication skills, during the study of the curriculum and beyond, as well as their ethical and professional skills.

# Pontifical School of Theology

## Overview

Under the official mandate given to the School by the Lebanese Assembly of Catholic Patriarchs and Bishops in 1974 and ratified by Rome in 1982, the Pontifical School of Theology works hard to ensure its students, most of which are preparing for ministry, receive a university theological education initiating students to the theological speech's critical and analytical method by promoting a constructive dialogue with other university majors especially philosophy and humanities. The Catholic Church in Lebanon recognizes through this choice that university theology is necessary to the revival of the pastoral ministry in the Church.

In addition, the Pontifical School of Theology is fully aware that its vocation is to be "oriental" and "catholic" just like the Church from which it depends and which it serves. Our school, with the help of the Liturgy Institute affiliated to it, has been concentrating since its foundation on shedding the light the best way possible on the oriental theology and its dogmatic, liturgical and spiritual components without neglecting occidental theological thought. Through this double approach, the school aims at providing a theological teaching in an ecumenical spirit.

The Pontifical School of Theology consists of the following programs:

### Undergraduate Studies

- Bachelor of Arts in Theology

### Graduate Studies

- Master of Arts in Theology

### Doctoral Studies

- PhD in Theology

## Administration and Full-time Faculty

Fr. Dr. Elias Ghattas Jamhoury, Associate Professor, **Dean**

Fr. Jad Kossaify, Lecturer, **Associate Dean**

### **Professors:**

Fr. Prof. Hady Mahfouz

Fr. Prof. Marwan Azar

### **Associate Professors:**

Fr. Dr. Antoine Al Ahmar

Fr. Dr. Antoine Mikhael

Fr. Dr. Ayoub Chahwan

Fr. Dr. Charbel Chléla

Fr. Dr. Charbel Kayrouz

Fr. Dr. Elias Hanna

Fr. Dr. Gaby Hachem

Fr. Dr. Jean Azzam

Fr. Dr. Joseph K. Azzi

Fr. Dr. Michel Abou Tacca

Fr. Dr. Wahib Khawaja

### **Assistant Professors:**

Sr. Dr. Dolly Chaaya

Fr. Dr. Toni Eid

## Undergraduate Programs

### Bachelor of Arts in Theology

#### Mission

The Canonical bachelor degree in Theology is a five-year basic program. It aims to impart a solid philosophical education, which is a necessary propaedeutic for theological studies, and to offer an organic exposition of the whole of Catholic doctrine, covering a coordinated presentation of all the disciplines, along with an introduction to theological scientific methodology.

#### Program Educational Objectives

1. Graduates will acquire a deep understanding of the entire catholic doctrine grounded in divine revelation, which allows them to gain nourishment for their own spiritual life, and to announce and safeguard it in the exercise of the ministry.
2. Graduates will acquire a personal theological synthesis, a mastery of the method of scientific research and thus be able to explain sacred doctrine appropriately.
3. Graduates will be ready to fulfill pastoral ministry and other functions in the Church, especially in the administration of a parish, in catechetical and homiletic skills, in divine worship, and particularly the celebration of the sacraments.

#### Program Outcomes

- a. Ability to understand major philosophical systems, especially those which exercise a greater influence in the region, and to discern what is proven to be true therein and detect the roots of errors and refute them.
- b. Ability to understand the characteristics of the contemporary mind, and enter into dialogue with men and women of today.
- c. Ability to read the Holy Scriptures in their original languages.
- d. Ability to explain biblical texts according to a valid method of exegesis and in the light of a comprehensive view of the whole of Sacred Scripture.
- e. Ability to announce in a suitable way the teaching of the Gospel and of the doctrine of the Catholic Church to the people of today in a manner adapted to their understanding.
- f. Ability to exercise a pastoral ministry in the Church.
- g. Ability to understand doctrine of non-Catholic Churches and non-Christian religions and enter into dialogue with them.
- h. Ability to examine theological questions by their own appropriate research and with scientific methodology.
- i. Ability to go on to the second cycle and pursue higher theological studies.

#### Degree Requirements

This program requires 151 credits for students entering at the sophomore level (holders of freshman or a recognized baccalaureate - equivalent to 30 credits), distributed as following:

| <b>Common Core</b>                         | <b>42</b> |
|--------------------------------------------|-----------|
| PSY201 - Introduction to Psychology        | 3         |
| SOC201 - Introduction to Sociology         | 3         |
| MTR222 - University Working Methodology    | 3         |

## Graduate Programs

### Master of Arts in Theology

The Pontifical School of Theology through its master program aims to become a center of teaching and research for the Truth. It is called “to offer the decisive contribution of leaven, salt and light of the Gospel of Jesus Christ and the living Tradition of the Church, which is ever open to new situations and ideas” (*Veritatis Gaudium*, Preamble, 3). It has a twofold purpose: first, “to deepen and systematically expose, according to the scientific method peculiar to it, the Catholic doctrine drawn from the sources of Divine Revelation, then to seek, in the light of this Revelation, solutions to the problems that men face” (cf. *Sapientia Christiana*, Art. 66; Art. 3) “in various cultures” (*Veritatis Gaudium*, Art. 3,1), according to the four criteria of *Veritatis Gaudium*: a. The prioritized and permanent criterion is that of contemplation and spiritual, intellectual and existential introduction into the heart of the kerygma, i.e., of the new and fascinating joyous proclamation of the Gospel of Jesus; b. Dialogue in all areas: not as a mere experience of the joy of Truth and to deepen its meaning and practical implications; c. Inter and transdisciplinarity exercised with wisdom and creativity in the light of Revelation; d. A fourth and final criterion concerns the urgent need to “forge a network” between various institutions which, throughout the world, cultivate and promote ecclesiastical studies” (*Veritatis Gaudium*, Preamble, 4).

#### Program Educational Objectives

1. Graduates will acquire fidelity to the Catholic Church Magisterium.
2. Graduates will consider particularly the great richness of Oriental Traditions.
3. Graduates will communicate the truth of the Gospel in the midst of religious pluralism without renouncing the truth.

## Doctoral Programs

### PhD in Theology

The third cycle normally extends over three years after which the student is given a Canonical PhD in Theology, which is equivalent to the PhD in Theology in the Lebanese System.

A minimum of 60 credits are required to obtain the canonical PhD.

## Course Descriptions

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                       |              |

| <b>MTR222</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>University Working Methodology</b> | <b>3 cr.</b> |
| This course will provide first year students with essential methods for the preparation of their work during the years of study at the University. These methods are common to all material and address different levels, ranging from exercises promoting correct educational attitudes in the introduction to the methods of work, the investigation of a text, and finally, to the mastery of speech essential to establish exchange with others, orally and in writing, and to assert with confidence and autonomy. In addition, the objectives of this course will address data essential for the design, drafting, and realization of research work.                                                                                                                                                                                                                                           |                                       |              |
| <b>PHI201</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>Introduction to Philosophy</b>     | <b>3 cr.</b> |
| The course will introduce students to philosophical thinking and practice. It will cover, on the one hand, the main philosophical trends, highlighting their specificity and their creative input and, on the other hand, the most representative authors in the history of philosophical thought. In an effort not to separate these themes and the fundamental questions of mankind, the course attempts to show the relationship that develops between the aforementioned notions; with the aim of addressing their impact on certain world views that constantly interpolate us within contemporary societies.                                                                                                                                                                                                                                                                                   |                                       |              |
| <b>PSY201</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>Introduction to Psychology</b>     | <b>3 cr.</b> |
| This introductory course is also enrolled in general education as a prerequisite for students who will pursue psychology training. This course will provide students with the basic concepts in psychology and will facilitate their access to knowledge during their academic curriculum. It includes the following objectives: understanding psychology from a historical and a theoretical perspective (Gestalt, phenomenological, experimental, scientific, psychoanalytic and cognitive, etc.); understanding the various fields of psychology (clinical, experimental, developmental, educational, social, etc.) and the different methods used (experimental, clinical, psychometric, projective, etc.); providing an appropriate approach to personality issues - basic needs, affective and emotional (feelings, emotions), intellectual (cognition, memory) and social (social influence). |                                       |              |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                           |              |

| This course provides a basic knowledge of general sociology: a) it presents an overview of the context of the event-emergence of sociology on the basis of the main founders and focuses on methodological perspectives and applied sociological methods and techniques; b) it focuses on the key principles of social themes, which description and definition have fueled and fed the many debates that are changing the discipline in the vast corpus of scientific knowledge. This course provides students with general sociology elements, sensitizes their sociological perspective and develops their critical reflection on various social issues.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                           |              |

| This course is divided into two parts. The first part examines pre-Socratic sources that give students the proper tools to acquire philosophical thinking in their quest for the nature of things, and in their attempt to unveil both natural and human phenomena. It thus includes the main schools of thought such as the School of Miletus (Thales, Anaximander, Anaximenes), the Pythagorean school (Pythagoras), the Ionian school (Heraclitus), the Eleatic school (Parmenides), as well as the Sophists. The second part deals with Socrates, Plato and Aristotle.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                           |              |

| This course is intended to develop, in the first part, the philosophical question of existence of Kierkegaard and other existentialist philosophers (Sartre, Jaspers, Scheler, Gabriel Marcel). This course analyzes, in the second part, the basic principles of phenomenology as defined by Edmund Husserl and by numerous contemporary phenomenologists. In this framework, the course explains the Husserl phenomenological heritage and its innovative Heidegger reception. Different manifestations of phenomenological practice and its particular development will be considered within the French phenomenological school represented by Maurice Merleau-Ponty, Emmanuel Levinas, Henry Michel and Jean-Luc Marion. Particular attention will be given to the Michel Henry's phenomenology of life.                                                                                                                                                                                                                                                                                                                                |                                           |              |

| This course is designed to analyze the highlights of the thought of St. Augustine, St. Thomas Aquinas and Meister Eckhart. We seek, from the analysis of the Augustinian singular experience of truth, to understand in depth the issues relating to the problem of knowledge, the metaphysics of inner experience, the self-certainty based on the truth of God immanent in our interiority, temporality and eternity and the unitive and tripartite constitution of the same soul to the constitution of the Trinitarian life in God. We will study, starting from a critical reading of the writings of St. Thomas, the themes related to the receipt of Thomistic Aristotelian heritage, the question of creation and the evidence of the existence of God, the question of analogy and the problem of knowledge. A contemporary reading of the mystic Meister Eckhart, which largely contributed to the emergence of German philosophical speculation, will be analyzed as well. The research will, at this level, tackle Eckhart's unitive structure of knowledge and life, that animates the vital relationship between God and man. |                                           |              |

| Among the Greeks, nature is physical, all of which appears; hence the problem of natural, supernatural and the supernatural. In Christian theology, nature is one; hence the problem of the two natures of Christ. In Latin, natura is "character", which poses the problem of nothing less than human nature. In medical sciences, nature bounds genetics. In law, it opposes the Civic. In literature, it opposes romanticism and classicism. Today, ecology seems to oppose nature and man; it is even about "green policy" as of 'ecological theology,' 'brief 'ecological philosophy'.' Nature is everywhere, but is the concept of nature the same thing everywhere, in all areas? What is then "nature"? A kind or nature? And why is the definition a hermeneutical problem? That's what our course of Philosophy of Nature will try to address.                                                                                                                                                                                                                                                                                    |                                           |              |

| <b>Pre-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | PHI210 or SOC210                          |              |
| The question "What Is Man?" is at the heart of philosophical questioning. Starting from the anthropocentrism need of philosophy, the course firstly explores the meaning of the question about the essence of man through its history, the challenges imposed by the cyborg, the computational world or gender theory (Gehlen, Leach, Butler, Blumenberg, etc.). The course questions the difficulties of defining the human being through current changes by building on the thinkers of classical humanism and post-humanism. Secondly, the course presents the basic categories of philosophical anthropology and offers a thorough analysis of the being-in-relation (or the human being-in-relationships) and discussion of political, social and cultural implications, with reference to contemporary thinkers of otherness (Levinas, Buber, Marion, etc.).                                                                                                                                                                                                                                                                          |                                           |              |

| The students will be introduced to two great philosophical currents, both stemming from the works of Francis Bacon, rationalism (Descartes, Leibniz and Spinoza) and empiricism (Locke, Condillac, Hume), leading to Kant's philosophy of knowledge - critical rationalism.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                           |              |

| This course initially outlines a perspective of language as an object of study that shows how much of the philosophy of the twentieth century developed as a philosophy of language (Analytic Philosophy). Secondly, it deals with the general theoretical framework of the argument as a discursive act, based on the theory of acts of language (speech acts), that the two philosophers Longshaw John Austin and, later, John Searle paved the way for. Thirdly, general issues related to logic are discussed, and are examined by the induction and deduction master concepts - truth and validity. A brief discussion is given on the methods and endorsements of formalization. The formal approach is exemplified, when it comes to conducting the analysis and evaluation of simple deductive arguments, called syllogism.                                                                                                                                                                                                                                                                                                         |                                           |              |

| <b>Pre-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | PHI210                                    |              |
| The course aims to consider a reflection on the foundations and the meaning of democracy, in order to find the place of morality in politics; knowing that the two concepts "moral" and "politics" are written mostly in separation rather than in conjunction. This is how we can understand the great debates relative to moral and political philosophy, from the ancient Greeks - particularly those of Plato and Aristotle - until modern or contemporary times. Starting with an approach to these two concepts, the course is essentially questioning, on one hand, the need for the interaction of these two areas of morality and politics, and also that of their separation. Students will analyze in-depth the answer to these questions by drawing on texts of classical and modern philosophers such as Plato, Aristotle, Kant, Machiavelli, Thomas Hobbes, Max Weber, Hannah Arendt and Julien Freund, who have pondered this topical issue.                                                                                                                                                                                 |                                           |              |
| <b>PHI453</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>Hermeneutics</b>                       | <b>3 cr.</b> |
| <b>Pre-requisites</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | PHI210                                    |              |
| Having originated within the context of biblical interpretation, hermeneutics was freed from its dogmatic and institutional limits to become a discipline that mediated and reconciled stylistics, trans-linguistics, word-for-word linguistics and dissertation analysis, as well as a reading of the world as text. It is the restoration and disclosure of meaning that interprets and identifies the significance of the written and spoken word. The course traces the journey that this discipline has made from Schleiermacher to Ricoeur, as well as Dilthey, Heidegger, Gadamer, Szondi, Jaussand and Appel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                           |              |

| The course focuses on two distinct but complementary parts. The first socio-political and historical part is the source of modern Arab thought, born in the Ottoman Middle East, of language and Arab cultural heritage. At the origin of this modern thought, expressed in the Arabic language and in the service of the promotion of Arab society, are Lebanese Christians, mostly, and in particular, Syrian and Egyptian. New concepts circulate, such as tolerance, freedom, equality, brotherhood, citizenship, etc., allowing the contribution of new transnationalistic, Arabic and nationalistic ideas, operating progressively in favor of the introduction of a democratic political regime that would terminate the dictatorship and the cult of "me" politically translated into a sultanate recognized as the shadow of God on earth. The second part focuses on the emergence of a political, socialist, communist, progressive, Baathist, Nasserist, democratic thought; work of the enlightened Christians and Muslims in the Arab world in search of a new national ideology, which tried to contribute to the emergence of a state concept, an identity that includes all the components of a national community and a political philosophy capable of challenging the rapid changes within the global plan. The aim of the course is to enable students to grasp the dimension of Arab thought outside the religious framework that limits the concept of state and denies democracy the right to be admitted. |                                                   |              |

| The objective of this course is to introduce students to the reading of the Greek text of the New Testament and to its translation, by studying the main principles related to the grammatical and syntactic systems of the Greek language and the minimum required vocabulary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                   |              |
|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>Biblical Hebrew</b>                            | <b>3 cr.</b> |
| The objective of this course is to help students in theology read and translate the Hebrew biblical texts and analyze them grammatically, in order to prepare them for biblical exegesis. The study of the Hebrew language will mainly focus on the Hebrew grammar (morphology and syntax) based on a selection of Hebrew texts from the Bible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                   |              |
| - The 1 <sup>st</sup> level of grammar will cover morphology and nouns, while the 2 <sup>nd</sup> level will cover verbs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                   |              |
| - The texts will include readings and translations, and grammatical analysis of selected passages from the Pentateuch, the books of the Prophets and the Psalms.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                   |              |
| <b>THEO213</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>Introduction to the Bible</b>                  | <b>3 cr.</b> |
| The Introduction to the Bible course aims to answer questions whose knowledge is a prerequisite to understanding the inspired Book, though written in well-defined historical, social and cultural contexts. More specifically, it is related to the history of the biblical texts writing, of sacred history that is told therein, the world of the Bible, its geography and its various political and religious movements. The course also outlines the history of biblical exegesis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                   |              |

| This is the first course on the Old Testament. It aims to introduce students to the biblical exegesis and allows them to be well-informed about this biblical corpus, its books, its characters and its theology. After a brief introduction on the importance of the Pentateuch in the Old Testament, the course highlights a detailed reading of a number of texts covering different literary genres and theological currents of this corpus. This will lead to the understanding of the biblical concept of history and its theological meaning, as well as its key issues such as land, election, royalty, politics, and exile.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                   |              |

| The synoptic writings are introduced in this course, namely: the Gospels of Mark, Matthew and Luke, in addition to the Acts of the Apostles which is the second volume of the Lucan work. The course starts with an introduction on the synoptic question and the adoption of the modified theory of the two documents, followed by the study of each of these writings and their most important themes. The approach is synchronic. The method adopted is criticism of the composition which is a specification of the writing criticism which reviews the editorial activity of the author in order to discover the theological thought.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                   |              |

| This is the introductory course to theological studies which also addresses the foundations of Christianity, divine revelation and faith. First, it explains what theology is, by exploring its history, specifying its nature, its methods, its purpose, and by presenting its fields of reflection, and the different theological disciplines, along with a particular focus on fundamental theology. The second part of the course is devoted to the themes of Revelation and Faith, in addition to the study of the main theological concepts, the Word of God, the living Tradition, and the Church's Magisterium.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                   |              |

| This course is an introduction to Catholic ecclesiology found in the documents of the Second Vatican Council, particularly in the Dogmatic Constitution <i>Lumen Gentium</i> , its ultimate expression and the fundamental source of renewing the concept of Church in fidelity to the Bible and to Tradition. After a brief biblical introduction of the word "Church", we will first explore the Trinitarian foundation of the Church where the latter proves to be at the same time the <i>People of God</i> , <i>Body of Christ</i> and <i>Temple of the Holy Spirit</i> . In the second part, we will discuss the four Church attributes as mentioned in the Nicene-Constantinopolitan Creed, namely unity, holiness, catholicity and apostolicity. We will conclude by studying the Church's relationship with the world, from the perspective of the expansion of the reign of God in Jesus Christ. The theme of the Christian presence in Lebanon and the Middle East will also be highlighted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                   |              |

| Christology is the core and foundation of the Christian dogma. It presents, develops and explains the fundamental profession of Christian faith: "Jesus of Nazareth is the Christ, the Son of God, our Lord and Savior." It is the principle of the whole Christian theology, and the short word of faith. The course is based on four main movements. The first is devoted to listening to the Word of God, the standard and basis of all Christological thoughts. After a brief introduction on historical research on Jesus, we will explore the original experience of the New Testament communities, seeking to present their testimony on Christ following its chronological and thematic development. The second movement follows the development of faith in Jesus in the living Tradition of the Church, through the thought of the Fathers and the most important dogmatic decisions of the ecumenical councils. The third movement deals with contemporary Christology developed through a surprising variety of Christological movements which express, each in its own way, the present status of faith and the main place occupied by Christ in the life of Christians and every human being. Finally, in the fourth movement, Christology is reflected through soteriology which shows that personal communion with Jesus through faith achieves the aspiration of people for salvation and deification.                                                                                                            |                                                   |              |
| <b>THEO251</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>Fundamental Moral Theology</b>                 | <b>3 cr.</b> |
| This Fundamental Moral Theology course deals with the Christian action in a rational process, while relying on the Holy Scripture, and placing Tradition, Magisterium and human sciences within a contemporary situation scenario. The course will particularly address: Biblical perspectives of moral theology, its creative evolution and fundamental principles, such as freedom, responsibility, will, the good and the bad in the act, conscience, law, sin, conversion, salvation and revelation, theological and human virtues, bliss as the end of all Christian actions. Following a careful reading of the Veritatis Splendor                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                   |              |

encyclical and the document of the International Theological Commission on the natural law, we will present some new perspectives for moral thoughts, illustrated and enlightened by two concrete examples.

**THEO311 The Prophets 3 cr.**  
The course aims to study the prophets' school of thought, their writings, their role in the history of salvation and the major themes of their preaching. This course is based on a text analysis with all the available exegetical techniques. However, these writings are sacred and revealed texts, containing a theology and a religious message that are valid for every believer. It is therefore necessary to grasp their theological meaning and discover their relevance in our life today.

**THEO312 Johannine Corpus 3 cr.**  
This is an introduction to the Johannine corpus, with particular emphasis on the fourth Gospel. The course will focus on the texts themselves, and on the different environments of their composition. In order to approach these testimonies of faith, passages under study are resituated in the historical context of their development and analyzed using narrative and rhetorical strategies used by the authors of communal and personal literary books.

**THEO331 The Holy Trinity 3 cr.**  
This course deals with the mystery of Trinity which is at the heart of the Christian faith, the core of the Gospel and the Christian mark of discourse about God. It starts with an introduction designed to show the place of Trinitarian theology in the whole Christian dogma, and consists of four parts, biblical, historical, systematic and patristic, in order to rejoin in their own site in the ever-actual places of any Trinitarian theology.

**THEO351 Social Ethics 3 cr.**  
The course deals with both the relationships between members of the same society, and those between various societies. It opens the way to a very wide field, that of social issues addressed from the perspective of the Church's social doctrine, and enables students to deepen their thoughts and actions on various themes: the dignity of the human being created in the image of God, human rights, labor as the key of social issues, economy, peace, politics, and role of the family. In our analysis of the different themes of social doctrine, we will use their anthropological and theological foundations in the Scripture, the main principles developed by the Fathers of the Church and the teaching of the Magisterium stated in official documents from *Resum Novarum* (1891) until *Centesimus Annus* (1991). Finally, we will address the question of social morality from a pastoral point of view based on the current vision of the Church.

**THEO411 Pauline Corpus 3 cr.**  
The course mainly focuses on the thirteen epistles which are part of the Pauline school. It covers the epistles ranging from the Romans to Philemon, as ranked by our Bibles. Before studying the epistles themselves, we start with two preliminary parts. The first part studies the life of the Saint Paul according to the Acts and to the epistles; the second part presents the epistolary genre, the categories of epistles and some hints for a better understanding of the studied epistles.

**THEO412 Psalms and Wisdom Scriptures 3 cr.**  
The wisdom books are an assortment of the Old Testament books seeking to convey a moral teaching. This set includes the Psalms, Book of Job, Proverbs, Ecclesiastes, Song of Solomon, and Wisdom. Given its complexity, biblical wisdom requires a global approach to its various aspects, before covering in detail its modes of expression and its themes. This course will enable students to become more familiar with the Psalms and the other various wisdom books, in order to better grasp the development of wisdom harvested throughout the journey of the Israelites and which remains valid to this day, and to better understand the New Testament. The course will shed light on the fundamental biblical themes found in the Psalms such promise, marriage, descent, land, blessing, royalty, messianism, worship, and fidelity. The Wisdom literature will be studied; some books almost completely, others partially. An overview of each book will be given.

**THEO431 Christian Anthropology 3 cr.**  
This course consists of three distinct parts, namely the treatise of creation, the treatise of original sin and the treatise of grace. It aims to explain the content of the Christian doctrine of creation of the human being in God's image, with different biblical positions in opposition to scientific theories of origins. Then, the course examines the doctrine of original sin and attempts to formulate the problem of evil by explaining the impact of sin on the situation of the human being. After a brief overview on the scriptural doctrine of the original sin, we cover the Augustinian doctrine of the original sin, by reviewing ecclesial decisions and scholastic theology. At the end of the course, we tackle the theme of grace in order to better grasp the significance of salvation that culminates in the incarnation of Christ and the meaning of the human being's life as a creature totally open to Him, and this in communion with all creatures.

**THEO432 Eschatology 2 cr.**  
In the Nicene symbol, the "resurrection of the flesh" and "eternal life" are the last explicitation of faith in the Holy Spirit. Life under the Holy Spirit possesses a dynamism that tends to a future fulfillment, during which it will reach its entire fullness. The course is divided into two stages: first, we will study the general, collective and universal eschatology, that is to say, the completion of the world, and then move to the individual eschatology or the fulfillment of the individual. This order responds better to the account of the biblical history of salvation, and clarifies at the same time an intrinsic logic: hope for the individual is placed in a broader horizon, that of hope for the world

**THEO451 Family Ethics, Sexuality and Marriage 3 cr.**  
Based on a Christian anthropology, marriage and sexuality involve human and spiritual attitudes, which, along with the physical and corporal activities related to it, engage the whole human person. The history of salvation progressively reveals the ultimate and deep meaning of sexuality and marriage, namely the love that is rooted in God's love. However, conjugal sexuality requires an awareness of the inevitable link between its many dimensions: physical, psychological, social, cultural and religious. Through their union, morality and Christian faith have values that grant dignity to human sexuality. On the other hand, forms of cohabitation and marriage, influenced by gender theories, as the PACS, cohabitation, marriage for all, are on the rise in several societies, threatening therefore the "traditional" image of marriage and family. It is urgent and useful to rediscover the principles and values of the Catholic Church teachings on the sacrament of marriage and the family in order to meet the challenges that these forms cause to its pastoral care of the family.

**THEO452 Bioethics 2 cr.**  
Human beings have gained more and more power over nature due to the development of science and technology. And thanks to advances in biology, they are seeking to control health, reproduction and genetics. Hence, the eternal question is: Is what is possible desirable? This biological-techno-scientific turmoil which underlies effective medicine meets another socio-cultural and ideological debate that has influenced the representations of life and death, health and sickness, care and preventive, and curative or palliative treatments. These changes have led to a huge social and intellectual phenomenon embodied with the emergence of the term bioethics in 1971. The bioethics course covers three areas: reproductive technologies (artificial insemination, in vitro fertilization, prenatal diagnosis, abortion, contraception, and genetic engineering); the application of techniques at the end of life (euthanasia, palliative care, and organ harvesting); and medical experimentation on the human body and cloning.

# **Learning and Teaching Excellence Center (LTEC)**

## Mission

The Learning and Teaching Excellence Center (LTEC) at the Holy Spirit University of Kaslik is dedicated to the development of the professional qualifications of educators in teaching and learning through the promotion of teamwork, innovation, self-reflection and the efficient use of instructional technologies, and through sharing best practices to enhance the student learning experience.

LTEC serves USEK and non USEK faculty members by engaging and supporting them in their research-based teaching and learning concepts, and bringing them into intentional daily practice both inside and outside the classroom.

The LTEC provides a number of tools that can improve and enhance the online teaching and learning process, and also offers training on emerging digital platforms (such as e-learning) that can be used in both distance and face-to-face classrooms.

## Objectives

The main focus of the Learning and Teaching Excellence Center at the Holy Spirit University of Kaslik is to support, promote and enhance teaching effectiveness and student learning.

LTEC aims to:

- Facilitate the professional and intellectual development of faculty, staff, and graduate students as educators.
- Promote and support a community of teachers where the theory and practice of teaching and learning are shared.
- Help faculty members develop, implement, and assess instructional approaches and methods.
- Foster innovations in Higher Education teaching and learning.
- Advocate appropriate use of technology in enhancing university teaching and learning.
- Help individual instructors assess their teaching effectiveness and their students' learning.
- Sustain a university culture that recognizes and rewards both scholarly teaching and the scholarship of teaching and learning.
- Develop and maintain learning systems and technologies that can be used by staff and students across the university to facilitate and enable the online and hybrid teaching and learning process.

## Activities

The Learning and Teaching Excellence Center at the Holy Spirit University of Kaslik offers diverse activities in order to meet the professional needs and development of its educators.

- Training on instructional technologies in teaching and learning
- Training on program design and evaluation
- Workshop on integrated course design and assessment
- Online courses on online course design
- Brown bag sessions
- Training on Course Design
- Training on Syllabus Design
- Training on Learning Management Systems (LMS) and E-portfolio Fundamentals
- Training on Copyright and Fair Use
- Training on Distance Learning

## Programs Offered

- Post-Graduate MA / Certificate in Learning and Teaching for Higher Education
- Post-Graduate Online Certificate in Teaching and Learning
- Post-Graduate Intensive Track Certificate
- Online Course About Online Course Design

## MA / Certificate in Learning and Teaching for Higher Education

USEK offers a MA/Certificate in Learning and Teaching for Higher Education. It is designed to equip professionals who already have subject matter expertise within their academic discipline with the knowledge, skills, and credentials to teach at the university level or train in a corporate setting. Throughout the program, participants will examine the roles and responsibilities of faculty and students and acquire skills for effective teaching in both online and in-person settings. Key curriculum objectives include learning how to craft educational experiences for diverse learners, creating effective assignments and classroom materials, and developing and sustaining a vibrant learning community.

### Program Educational Objectives

1. Graduates will support and contribute to the growth of the higher education learning community;
2. Graduates will become professional educators and promote amongst their students the notion of proactive, autonomous, lifelong learning and to increase the flexibility of program delivery, improve access, and emphasize the increasing significance and potential of technology enhanced learning, teaching and assessment;
3. Graduates will demonstrate leadership and initiative to ethically advance professional goals, and facilitate the achievements of others.

### Program Outcomes

- a. Analyze and explore the role and function of teaching and learning in higher education;
- b. Apply theories of learning, teaching and assessment for making critical judgments of performance within the HE setting;
- c. Use appropriate skills of curriculum design, teaching and assessing;
- d. Develop reflective practice and experiential learning in teaching and learning facilitation;
- e. Review their own professional needs, and plan and undertake relevant and appropriate activities to meet these identified needs;
- f. Develop their skills and understanding in designing and conducting their own research into practice;
- g. Undertake critical evaluation of research into learning and teaching in higher education and provide them with the skills and knowledge to participate in such research;
- h. Utilize all learning opportunities to maintain and enhance personal and professional growth;
- i. Show a commitment to teamwork while working with others of diverse cultural and interdisciplinary backgrounds;
- j. Conduct researches to strengthen knowledge and critical understanding in teaching and learning.

### Program content

The MA in Learning and Teaching for Higher Education is organized over 2 to 3 years with four modules in addition to the thesis dissertation or seminar delivery that lead to obtain the Master degree:

#### Module 1: Teaching and supporting learning in Higher Education (9 credits)

##### LTE505 - Learning theories: building your philosophy of T&L (3 credits)

This course provides a detailed analysis of modern learning theories and practices as they relate to education. The question, “how do humans learn (best)?” is at the heart of such theories, and faculty are invited to construct and reconstruct their personal theories of teaching and learning throughout the course. It embarks on a detailed investigation of major research in educational psychology focusing on learning cognition.

##### LTE510 - Active learning strategies (3 credits)

This course explains how active Learning includes a range of teaching and learning activities. These strategies, supported by decades of classroom research, may be thought of as a continuum from low risk to high risk for both teachers and students. The course will also explain how more complex and higher risk as well as highest risk processes might include in active learning activities.

##### LTE515 - Faculty leadership skills for student’s motivation and supporting learning (3 credits)

This course studies how leadership influences student learning. According to the evidence compiled, Faculty will learn how leadership tends to be greatest in teaching where the learning needs of students are most

acute and how do high-quality leaders achieve this impact while setting directions in course delivery and developing people.

### **Module 2: Assessment, feedback and discipline specific pedagogy (6 credits)**

#### **LTE520 - Assessment and feedback (3 credits)**

In this practical course, faculty will learn how to create and use assessment tools that improve instruction (formative assessments) as well as gauge its success (summative assessments), and how to arrive at an effective balance of the two. The course demonstrates how educators come away with tools and strategies that they can use immediately, making balanced assessment an integral part of their own instruction.

#### **LTE525 - Discipline specific pedagogy for effective learning (3 credits)**

While the principles of pedagogy remain the same, discipline areas have different ways of teaching that work best for that discipline. Discipline specific pedagogy is not the same as habits of teaching that grow up among groups of teachers in sections. Teachers understand and develop discipline specific pedagogy best by talking to people outside their own discipline as well as those inside.

### **Module 3: Designing and evaluating for learning and teaching (9 credits)**

#### **LTE530 - Integrated course and program design (3 credits)**

The course on integrated course and program design enables participants from all areas of higher education to reflect on the power of creating good courses; courses that are based on significant learning experiences in and out of the classroom. By focusing on learner goals, teaching activities and assessment of learning, participants develop a template they can use in creating their own course that integrates these three areas. Of particular value is Fink's Taxonomy of significant learning: foundational knowledge, application, integration, caring, human dimension and learning how to learn.

#### **LTE535 - Course and program evaluation strategies (3 credits)**

This course will be focused on giving you hands-on experience in the specific research skills and tools required for effective program evaluation. Individual written assignments will build on each other over the course of the semester, culminating in a final paper documenting your evaluation plan for a real-world project.

#### **LTE540 - Instructional technology for supporting learning (3 credits)**

This is a course involving the selection and use of various educational technologies within an instructional design framework. Students will be exposed to various ways of thinking about educational media and technology. The course provides students with experiences that enable them to integrate technology resources to support clearly defined learning objectives.

### **Final thesis dissertation or Seminar delivery (6 credits)**

#### **LTE690 - Final thesis dissertation (6 credits)**

This course is designed to assist students in the completion of their research paper or graduate project. The expectation is that all students begin this course having already attended the modules 1 and 2. Therefore, this course is designed to provide guidance in the final completion of the research paper/graduate project until achieving the oral defense.

#### **LTE695 - Seminar delivery (6 credits)**

This is a course that trains students to present an in-depth examination of a topic in Teaching and Learning through the delivery of a professional seminar and to observe and listen to how scientific research is presented.

### Post-Graduate Online Certificate in Teaching and Learning

In collaboration with Norwich University in the United States, USEK offers an Online Certificate in Teaching and Learning. The program consists of two 11-week courses given online through the University's flexible online platform, allowing faculty to access program content and contribute to weekly class discussions in their own time and at their own pace.

**NORWICH**  
UNIVERSITY

*Online*

### Post-Graduate Intensive Track Certificate

“The Professional Educator”: “The Professional Educator” program is a special Faculty Development Module offered with the collaboration of the UT Global Initiative for Education and Leadership at University of Texas at Austin. The training module, based on ten days of instruction offered at USEK main campus, is designed for the Professional Educator to acquire instructional best practices, as well as assessment tools and techniques, and is available to USEK and non USEK full-time and part-time Faculty members from various disciplines.

**Global Initiative for Education  
and Leadership**

### Online Course about Online Course Design

LTEC provides online courses about online course design with the collaboration of Dee Fink and Associates.

# **USEK Continuing Learning Center (UCLC)**

## Introduction

The USEK Continuing Learning Center (UCLC) was founded as a response to demands for continuing education and professional development on the local and regional market.

In line with the University's commitment to providing high quality learning and engaging with the local community, the UCLC provides a wide range of courses designed for learners at different levels at suitable times for individuals with a busy schedule and other responsibilities.

As educators, we aim to meet the needs of people of all ages interested in continuing education and lifelong learning, to respond to the local and regional market needs by offering continuing education opportunities, and to provide learning opportunities to various local community groups (professionals, inspiring entrepreneurs, students, etc.) by offering a selection of quality educational programs and professional development opportunities at different levels. In so doing, we help people from various professional backgrounds acquire the skills and experiences that enable them to face the cultural, social, and technological changes and developments caused by the rapid progress in communications and information technology.

## Letter from the Director

Education never ends. Once you obtain a specific degree in a particular discipline, continuing education is a practice that many people pursue. It is a lifestyle, one which a person is keen to live and achieve by persevering to acquire various sciences in a range of knowledge fields and relying on personal, professional, or training experiences regardless of age, time, or place, as long as education remains the main target.

The USEK Continuing Learning Center (UCLC) provides interdisciplinary courses designed to meet the lifelong educational and training needs of adult learners at all educational and professional levels. Connecting with USEK's faculty and schools, the UCLC provides non-credit courses and programs in many areas to serve the local and regional community. Course offerings are constantly revised and developed to meet the ever-changing demands of the professional workforce.

We invite you to review this catalogue and find out how the UCLC can help you achieve your personal and professional goals. In this context, we will accept nothing less than to play a crucial role in the region and beyond in providing lifelong learning opportunities for individuals from all educational and professional backgrounds.

**Fr. Wadih Skayem, Director**

**USEK Continuing Learning Center (UCLC)**

## Background

Since its founding, USEK seeks, and in accordance with Article 92 of the Constitutions of the OLM (ed. 2012) and the social teaching of the Catholic Church on universities, to contribute to the development of all its students through quality educational programs and research in various fields of study.

In this context, the USEK Continuing Learning Center (UCLC) promotes USEK's motto, "When the Spirit of truth comes, he will lead you to the whole truth" (Jn 16:13), and stands at the heart of USEK's strategic plan in extending the resources of the University to the community by providing high-quality personal development opportunities for individuals from various educational and professional backgrounds and remaining committed to a faith-based educational development, whereby spiritual values and ethics as well as respect for cultural and religious pluralism are promoted.

A variety of non-credit professional courses and programs is offered to participants aged 18 and above. All courses delivered by the UCLC consist of a minimum of 15 contact hours and a maximum of 60 contact hours per course.

## Mission and Vision

The mission of the USEK Continuing Learning Center (UCLC) is to meet the lifelong educational and training needs of adult learners at all educational and professional levels. UCLC aims to improve the professional and technical skills of learners by addressing their needs for personal development and cultural enrichment.

Our vision is to become a leading educational center offering quality learning and training in a variety of fields in the region and beyond.

## Policies

### A. ADMISSION

To register in one or several courses, kindly fill in the Online Registration Form and select the chosen course(s). You will be asked to upload a scanned copy of your ID card (or passport for foreign students) and a photo. A confirmation email and a payment link will be sent to you shortly after.

### B. ENROLLMENT AND REGISTRATION REQUIREMENTS

The UCLC Courses are open to anyone who is 18 years old and above. While there are no pre-requisites for most courses, some courses may require prior education and/or experience to obtain maximum benefit. To register in one or several courses, kindly fill in the Online Registration Form and select the chosen course(s). You will be asked to upload a scanned copy of your ID card (or passport for foreign students) and a photo. A confirmation email and a payment link will be sent to you shortly in order to complete the payment.

Note: Students already at USEK can enroll in any course without prior payment, the UCLC tuition fees will be added directly to his/her account.

### C. PAYMENT POLICY

Once you have registered online, you may choose between two payment options:

- via bank (Audi, Bank of Beirut, BLOM, Byblos – using your USEK ID number), or
- online by VISA/MasterCard (note: a 3.49% fee will be applied for credit card processing).

Please note that there is no registration fee. For course fees exceeding USD 1000 a payment plan is available upon request.

### D. WITHDRAW POLICY

If for any reason you must drop the course(s) or program, you will need to inform the UCLC by sending an email to [uclc@usek.edu.lb](mailto:uclc@usek.edu.lb) or by calling us on 09 600 821. A refund will be issued based on the drop period as stated in the Refund Policy below.

### E. REFUND

During the registration process, students must read the UCLC Refund Policy and verify that they have understood it. Below are the refundable amounts based on the drop period.

| Drop Periods                                       | Tuition Refunded | Tuition Payment |
|----------------------------------------------------|------------------|-----------------|
| Cancellation of class by the UCLC                  | 100%             | 0%              |
| Dropping the course one week before the start date | 50%              | 50%             |
| Dropping the course after 1st class session        | 0%               | 100%            |

If the refund request satisfies the above terms, the refund process will normally take 3 to 4 working days and the amount(s) will be refunded within 30 working days. Refunds are issued by check. The student will receive an SMS once the check is ready.

### F. COURSE CANCELLATION

UCLC reserves the right to cancel or reschedule any course due to insufficient enrollment or any other unavoidable circumstances. All registered candidates will be notified, and a total reimbursement will be made.

## G. ATTENDANCE POLICY

Students must attend all classes in order to complete the requirements of a course. For every hour of instruction, no more than fifteen (15) minutes can be missed. Arriving more than 15 minutes late at the start of a class or leaving more than 15 minutes early at the end of a class will also be documented as unsatisfactory performance. Instructors reserve the right to drop a student from the course if the student is absent more than 30% of class instruction time.

## H. CERTIFICATE

In order to be eligible for a course certificate, students are required to maintain regular classroom attendance and complete all program requirements.

Grades are not assigned, and the programs do not count towards a degree.

## I. GENERAL REGULATIONS

**Student ID card:** All UCLC Students will receive an USEK ID card which must be shown when entering the campus and accessing the parking lot. In case of loss or damage of the card, a duplicate can be made by the Registrar's Office for a fixed cost.

All students are expected to abide by the rules and regulations of the University.

## Courses

UCLC courses are designed to train and develop human resources in various sectors, including business, architecture and design, languages, arts and sciences, law and political sciences, engineering, and lifestyle, with a view to meeting the requirements of everyday life and work.

The following section elaborates on the courses offered in 2021-2022 and categorized into seven different specialization areas as shown below.

### A. BUSINESS

#### a.1 Budgeting and Cost Control for Businesses

Description: Business decision-making involves analyzing situations that entail varying degrees of risk. This course introduces you to the core principles of cost control and management accounting functions. It covers a range of central concepts, such as job costing and ABC costing. You will discover how to use costing to make informed management decisions and learn how to perform a cost-volume-profit (CVP) analysis and compile a budget for a business in keeping with its strategic plans and objectives.

Duration: 15 hours

#### a.2 Strategic Management

Description: This course will take learners on a journey during which they will learn to analyze the business environment of a company, select a strategy, and construct the organizational structure necessary to put such a strategy into action. Learners will be taught to use all the functional skills (i.e., accounting, finance, marketing, etc.) they have learned to study organizational problems within the context of real-world business case studies.

Duration: 23 hours

#### a.3 Auditing Standards and Procedures

Description: The AICPA's Accounting Standards Board distinguishes between auditing standards and audit procedures by stating that "Auditing procedures are acts that the auditor performs during the course of an audit to comply with auditing standards".

This course is intended to introduce auditing standards and procedures as a measure of audit quality and the objectives to be achieved in an audit, enabling learners to differentiate between internal and external audit, types of audits, types of auditing opinions, and the preparation of a complete audit file. It will explain how to act objectively by conducting highly systematic and independent audit work.

Duration: 20 hours

#### a.4 Ideation

Description: The ideation workshop is dedicated to teaching the methodology of ideating based on a problem or a need in an effective and innovative way. Generating an idea may seem easy but finding an innovative solution out of a problem is far from obvious unless you follow an analytical and critical thinking methodology. Participants will trigger their creativity by examining the issue, decomposing it, and suggesting multiple solutions for it. These options will eventually be narrowed down to come up with an innovative solution that answers the identified needs.

Duration: 6 hours

#### a.5 Start Your Business

Description: This course is dedicated to teaching the methodology of design thinking to validate the need for the proposed solution and assess its feasibility, viability, and desirability. You will learn the process of understanding consumer problems and needs, ideate around them to find solutions, choose a specific solution, and prototype/test it on the market.

Duration: 8 hours

#### a.6 Hospitality and Event Management

Description: This course will tackle event management from a simplified, yet different perspective. It will give participants a few tricks and tips for choosing a theme, planning it from A to Z, and working on different setups, in addition to many other related subjects.

Duration: 15 hours

#### a.7 Strategic Brand Management

Description: This course is intended to improve the learners' marketing skills and their understanding of specific branding topics, and to examine the "big picture" of how various aspects of marketing "fit together", all from a brand equity perspective. Specifically, the course aims to introduce:

- the role of brands, the concept of brand equity, and the advantages of creating strong brands.
- the three main ways to build brand equity by properly choosing brand elements, designing marketing programs and activities, and leveraging secondary associations.
- different approaches to measuring brand equity and how to implement a brand equity measurement system.
- alternative branding strategies and how to design a brand architecture strategy and devise a brand.

Duration: 23 hours

#### a.8 Introduction to Marketing

Description: As consumers and citizens, understanding marketing is a must, since someone is always trying to sell us something, hence the need to recognize the methods at play. This course is designed to explain the basic concepts and techniques required for the comprehension and application of the marketing process. The course also identifies the marketer's need for a broad range of skills to sense, serve, and satisfy consumer needs. By giving marketing a central role in the activities of an organization, it develops learners' understanding of marketplace realities, including organizational functions and the importance of incorporating a marketing perspective into any organizational (or personal) endeavor.

Duration: 15 hours

#### a.9 Marketing Management

Description: This course is an introduction to the essentials of marketing, including the creation of value for customers and firms, and the strategies and methods marketers use to successfully operate in today's dynamic environment. Specifically, the course goals are to:

- define the strategic role of marketing in the firm.
- introduce learners to the key elements of marketing analysis.
- provide a sound conceptual and theoretical "tool kit" for analyzing marketing issues.
- improve your understanding of the marketing process as a framework for looking at the world.

Duration: 15 hours

#### a.10 Digital Marketing

Description: Digital marketing influences all aspects of our commercial projects. Electronic media and technology enable organizations to acquire products and services and to sell goods and services to customers in the marketplace while optimizing internal communication, as well as communication with customers by monitoring the external environment. This course provides an overview of the e-marketing world and its strategic integration into business and relies on marketing principles to study specific platforms. E-marketing offers many opportunities for brands and their positioning. By addressing what is unique about e-marketing, the training explains how these technologies create value for customers and benefits for businesses and their brands. The training deals with various issues, such as:

- introducing electronic marketing and its technological foundations.
- explaining the commercial implications of digital marketing.
- understanding customer behavior on different platforms.
- discussing crisis management and campaign creation.
- tackling selling strategies on social media.

Duration: 15 hours

#### a.11 Global Marketing

Description: It is more important now than ever before for firms to recognize that they compete in a global environment. Consequently, managers must seek to develop the empathy, knowledge, sensitivity, and skills required to successfully operate in a dynamic global marketplace. Global marketing uses and builds upon the primary concepts previously covered in the principles of marketing and will enable you to practice applying these concepts in a global environment. Successful global marketers must broaden their knowledge to include the myriad of activities required to select, gain entry to, and compete outside their "home" country. They must also appreciate how crucial culture, environment, government regulation, and economic systems are in affecting the competitive advantage and strategic positioning of any given firm. This course will provide global marketers with an overview of these vital concepts.

Duration: 15 hours

#### a.12 Integrated Marketing Communication

Description: This course describes the basic principles and practices of advertising, while emphasizing the role of integrated marketing mix in brand management. It will highlight the key elements essential to the development of an advertising campaign as well as the media tools and planning needed to transmit a clear message to consumers about the brand. Additionally, the course will explain the importance of in-store marketing, sales promotion, and public relations in brand management.

Duration: 15 hours

#### a.13 Make Me a Leader

Description: Teamwork is not as easy as it seems, and every leader should be able to understand the various aspects it entails. Since leadership is a continually evolving process rooted in cooperating and communicating with others, this training will help explore the theory and practical methods of how to be a team leader. Participants will learn to understand the communication styles and techniques that any leader should master.

Duration: 15 hours

#### a.14 Make Me a Trainer

Description: Given the vital importance of training for personal development, this workshop provides a comprehensive overview of what it takes to become a trainer. Various activities, exercises, role play, and group work will be implemented, with training sessions introducing specific tips and techniques in an enjoyable and engaging atmosphere. Participants will gain practical experience by guiding other trainees to look for new approaches and how to be innovative trainers.

Duration: 15 hours

#### a.15 Mentoring with Numbers

Description: Logical thinking involves a variety of processes, including identifying and evaluating specific scenarios and action plans. It is vital to evaluate various perspectives to identify available resources and the short and long-term effects of any action. This workshop provides training on perspectives and arguments and shows how to assess the advantages of a logic-based plan. It also sheds light on how critical thinking and life coaching are related, and why we need to implement coaching methodologies in mentoring.

Duration: 15 hours

#### a.16 Etiquette, Protocol, and French Know-How

Description: The success of lasting professional relationships hinges on an atmosphere of respect and know-how among people, team members, etc. This course will teach learners from various backgrounds the rules of good manners underlying individual relationships in society, as well as the intricacies of common courtesy and related human values.

Duration: 15 hours

#### a.16 Banking Ethics, Data Protection, and Electronic Payments: Future Outlook and Challenges

Description: This course targets financial/banking sector professionals to help them gain a deeper understanding of the best practices for maintaining a code of ethics and compliance.

Employee responsibilities are explained under the data protection law so that they understand how to collect data legally, obtain consent where required, process data in accordance with the law, and ensure data security. The course also provides an overview of the various types of electronic payments along with the associated challenges and risks, in addition to an interpretation of the future of such payments.

Duration: 10 hours

#### a.17 Basics of Money Laundering and Terrorism Financing

Description: This course provides an awareness of money laundering and terrorism financing, and a better understanding of money-laundering/terrorist financing risks, mitigations, and sanctions.

Duration: 10 hours

## B. ARCHITECTURE AND DESIGN

### b.1 Basics of Digital Design

Description: This course introduces the basic circuits for digital design and the elements used for basic logical operations. Covering number systems, binary codes, digital arithmetic, logic gates, Boolean Algebra, and arithmetic circuits, it focuses on reasoning methods that allow the analysis or synthesis of logical systems. Such concepts related to logic circuits are important in the fields of information technology, telecommunications, industrial control, and many other areas.

Duration: 30 hours

### b.2 Technical Drawing and AutoCAD 2D and 3D

Description: The objective of this course is to initiate learners to technical drawings and to the use of the AutoCAD software. It is a first-time course about learning the fundamentals of reading and composing technical drawings in 2D and 3D. Learners are initiated to freehand sketching, multi-view drawing, section views, and building architecture drawing.

Duration: 30 hours

### b.3 Introduction to Painting

Description: This course teaches the basics of painting on paper and canvas, and how to choose a topic in correlation with the composition. Collage, gouache, aquarelle, pastel, acrylic, and oil are the techniques introduced in this course.

Duration: 15 hours

#### b.4 Fundamentals of Typography

Description: This course details the importance of typography in design and its essential significance in the graphic, printing, and digital fields, raising learners' awareness of the advantages of typography in communication. The course teaches character anatomy and its use in different contexts for optimal results aesthetically and practically. It also explains the criteria for choosing a font and the importance of font readability in all formats: books, magazines, posters, websites, logotypes, etc.

Duration: 15 hours

#### b.5 Arabic Calligraphy

Description: This beginner-level course in the art of calligraphy covers the history of Arabic letters, including type families (*Kufi, Raqaa, Naskh, Thuluth, and Diwani*), and initiates learners to the basic rules of Arabic calligraphy: the use of pens and inks, the proportions, the constructions and composition of letters and ornaments. Learners will practice through short exercises the use of the material, the proper handling of calligraphy pens, and letter tracing.

Duration: 15 hours

#### b.6 History and Culture of Furniture and Design

Description: Originating from the arts and crafts tradition and then associated with the field of design, furniture as an aesthetic proposal shares with any one of these fields a functional end. This course will enable learners to develop a culture of artistic, aesthetic, technical, and architectural knowledge associated with crafts, decoration, furniture, carpentry, design, trends, and interior architecture. Following a chronological fragmentation, learners will learn to identify furniture styles in an interior architecture context, starting from the origins of furniture making to the modern-day era, and to place it in its cultural, artistic, social, and architectural environment. The aim of this course is to help learners acquire the culture of workmanship. Taking into consideration historical and stylistic periods from the Antiquity until today, it covers the relational interaction between architecture, interior architecture, furniture, entity, design, etc.

Duration: 20 hours

#### b.7 Acting in Commercials

Description: Designed for those interested in acting specifically in commercials, this course is an introduction to the various acting techniques and casting agencies in Lebanon.

Duration: 15 hours

#### b.8 Script Writing

Description: This course covers the most important aspects of the art of writing for the screen. The topics covered include techniques for generating ideas, the drafting process, classical screenplay structure, conflict, characterization, dialogue, etc.

Duration: 15 hours

## C. LANGUAGES

### c.1 Arabic for Beginners

Description: This course aims to teach learners the basics of reading and writing Arabic letters, and to enable them to discuss common themes when expressing themselves and communicating in Arabic with native speakers. Grammar rules are taught through various texts, audios, etc. to help the learners speak and write correctly. Spread out over 15 hours of writing and speaking, the course follows the communicative and interactive educational method, with learners acting both as recipients and content producers.

Duration: 15 hours

### c.2 Syriac Language

Description : La langue syriaque, langue maternelle de Jésus , est un dialecte araméen, rendu célèbre par saint Éphrem qui en a en partie assuré la renommée internationale, et autrefois parlé de la Chine au sud de l'Inde et dans tout le Croissant fertile. Les cours porteront sur les thèmes suivants :

- l'histoire de la langue
- l'écriture
- la morphologie
- le lexique
- la syntaxe

Durée : 15 heures

### c.3 Spanish Language I

Description: This beginner-level course is an introduction to the Spanish language, with the learners learning to present themselves and others and to talk briefly about their country/city.

Duration: 30 hours

### c.4 Italian Language I

Description: This course is aimed at all beginners with previous exposure to the Italian language. The lessons will be given primarily in Italian, and the instructor will provide explanations in English only when necessary. The lessons will be based on a communicative

approach featuring everyday situations. The basic patterns and structures of the language will be pointed out so that the learners can acquire a basic knowledge of its specificity.

Duration: 20 hours

#### c.5 Chinese Language I

Description: This beginner-level course will teach learners the basics of the Chinese language, especially its characters, pronunciation, and tones. Participants will progressively get accustomed to Chinese characters, how to read/write them correctly and how to write and understand simple sentences as well as engage in basic dialogues.

Duration: 30 hours

#### c.6 English conversation

Description: This course will enable learners to hold a conversation in which they can voice their opinions and express themselves clearly on various subjects using well-constructed arguments and real-life examples.

Duration: 30 hours

#### c.7 French Conversation / Conversation en Français

Description : Ce cours permettra aux apprenants de tenir une conversation dans laquelle ils/elles pourront exprimer leurs opinions facilement sur divers sujets en utilisant des arguments structurés et des exemples concrets.

Durée : 30 heures

#### c.8 Computer-Assisted Translation

Description: This course aims to provide modern solutions for fast and accurate translation, as growing competition on the global market calls for ever new and speedy ways to translate our correspondence, offers, contracts, and various other communications.

Duration: 30 hours

#### c.9 Business English I

Brief Description: This starter business English course is designed to help learners, specifically businesspeople, understand business language to perform well in their field. The course focuses on content taken from a corpus of business language as well as on vocabulary from actual meetings in real-life companies. Business English learners will learn the skills and language that reflect the reality of working in business.

Duration: 30 hour

#### c.10 Business French I / Français des Affaires I

Description : L'apprenant pourra comprendre et produire une documentation simple liée au monde de l'entreprise : fiche de commande, facture, cahier des charges, etc. Il sera, par ailleurs, capable de tenir une courte conversation professionnelle, de se présenter dans le contexte professionnel, etc.

Durée : 30 heures

#### c.11 Film Translation: Subtitling and Dubbing

Description: This course provides learners, in the USEK Subtitling Lab, with the subtleties of subtitling from French and English into Arabic, as well as from Arabic into French and English, while exploring the techniques and specificity of audio-visual translation. The training material covers movies, series, sitcoms, and documentaries with or without scripts, along with working on the Poliscript Software.

Duration: 30 hours

#### c.12 Public Speaking

Description: This course will help participants build language confidence and acquire the skills needed to speak in public in both formal and informal settings. Participants will also improve their verbal and non-verbal communication skills to connect with their audience and will benefit from tips to overcome the fear of speaking in front of a large crowd.

Duration: 15 hours

#### c.13 Academic Writing

Description: Many learners may speak English well enough for shopping, travelling, and meeting people. Still, they are often surprised to find that writing essays, reports, and letters in English is much more difficult. This course is designed to help learners succeed in academic writing tasks. In addition to learning the stages of academic writing, including brainstorming, organizing, drafting, revising, and editing, they are also expected to take a critical approach to their sources. This means that they should question and evaluate the reliability and relevance of everything they read. Learners will be able to apply their new understanding of academic writing strategies to various types of correspondence, reports, case studies, literature reviews, questionnaires, and research papers.

Duration: 30 hours

#### c.14 English for the Workplace

Description: This course is designed for business executives, professionals, and office workers to help them build language confidence in business-oriented situations and develop fluency and accurate pronunciation. The course focuses on the vocabulary used in both business and general environments, as well as on the skills required to function in business. The course component covers oral presentations, business meetings, interviews, and many other topics.

Duration: 30 hours

## D. ARTS AND SCIENCES

### d.1 Modern Practices in Aesthetic Medicine

Description: This course aims at communicating the basic principles and operation of equipment, tools, procedures, and techniques involved in aesthetic medicine and cosmetology. Learners will acquire thorough knowledge of the scientific principles underlying skin physiology, pathophysiology, facial rejuvenation, non-surgical slimming treatments, and various laser applications. Moreover, the learners will develop the required skills that will enable them to perform adequate patient diagnosis and assessment, correct choice of technology or treatment, and appropriate manipulation of equipment.

Duration: 45 hours

### d.2 Cosmetic Formulation

Description: This course tackles the science of cosmetic formulation: the raw materials, their proportions, and the procedures needed to formulate a personal care product. It approaches the formulation of facial, body, sun, baby, and hair care, in addition to hair styling and hygiene cosmetics. At the end of this course, learners will be able to understand the list of ingredients of a personal care product, set a manufacturing procedure, and conduct stability testing. This course is a combination of lessons and live demonstrations.

Prerequisite : BS or MS in Chemistry, Biology, or Pharmacy

Level : Intermediate to advanced

Duration: 20 hours

### d.3 Cosmetic Formulation – Practical Part

Description: During the laboratory sessions, learners will create their own formulations based on a benchmark. They will learn how to choose the raw materials, their percentages, and how to prepare a formulation according to a specific target cost and to raw material availabilities. The 6 hours will be divided into 3 lab sessions.

Prerequisite : BS or MS in Chemistry, Biology, or Pharmacy

Level : Intermediate

Duration: 6 hours

### d.4 Cutaneous Biology and Skin Ageing

Description: This basic course about skin biology and skin ageing is useful for learners seeking to deepen their knowledge of skin and dermo-cosmetics. During this course, learners will learn about cutaneous biology: the skin structure, cells, and substances, how skin evolves with time, and the secrets of intrinsic and extrinsic aging. Learners who successfully complete it may enroll in an advanced course level, such as "The Skin and the Sun".

Prerequisite : BS or MS in Chemistry, Biology, or Pharmacy

Level : Beginner

Duration: 15 hours

### d.5 The Skin and the Sun

Description: This course describes the long-standing relationship between the skin and the sun, from the standard behavior of a sun-exposed skin to excessive exposure and the photo-aging process. It will help learners learn about skin reaction, skin cells behavior, and the physiological factors involved during sun exposure.

Prerequisite : BS or MS in Chemistry, Biology, or Pharmacy

Level : Intermediate to advanced

Duration: 15 hours

### d.6 Dermal Sciences

Description: This course aims at helping participants develop a comprehensive foundation knowledge in all areas of dermal science. Participants will develop the ability to adequately assess major dermal concerns and will acquire the necessary skills to perform safe and effective dermal treatments. They will also learn how to provide pre- and post-operative care for clients who have undergone plastic, reconstructive, and cosmetic procedures.

Duration: 30 hours

### d.7 All about Eyebrows SPMU / PMU/ REMOVAL

Description: Microblading artists can be found practically everywhere these days, so it is very important to know how to stand out from the crowd. There is no better way to do so than by gaining certification through a professional face design school, which will set you apart from other artists by allowing you to give your clients the most natural-looking hair strokes. This course covers pioneering eyebrow techniques in the PMU industry, such as microblading, micropigmentation, and tattoo removal. You will learn all about various factors that affect the end result, colorimetry, shaping, and face mapping, as well as the latest tips in this field. Hands-on practice will allow you to excel in drawing the right patterns using the diamond technique, while live demonstrations will help you master the hand and body positions of a confident beautician.

Duration: 24 hours

### d.8 Lash Lifting/Tinting and Brows Lamination

Description: This course covers everything about lash lifting/tinting, eyebrow lamination, and all the style trends that will let your clients coming back for more. The lash lifting part of the course covers how to achieve a gentle and effective lash lamination results, while minimizing the risk of over-processing and keeping lashes healthy by adopting a tailored approach to this on-style technique.

The eyebrow lamination part of the course will enable you to successfully draw a uniform full eyebrow shape to create a brushed-up brow look. This technique is the ultimate solution for eyebrows where the hairs grow asymmetrically. Lamination (also known as lifting) helps realign the brows and give them the desired shape with results that last up to 6 weeks. Live demonstrations and hands-on practice will teach you how to master the hand and body positions of a confident beautician.

Duration: 6 hours

#### d.9 Plasma Fibroblast

Description: Plasma fibroblast is the latest craze in the world of beauty trends. This new course will introduce you to this non-surgical revolutionary procedure for perfect skin rejuvenation through tightening and lifting. You will learn the principles of plasma treatment, anatomy, and physiology, in addition to the latest techniques, hygiene safety, and aftercare.

Live demonstrations and hands-on practice will teach you how to master the hand and body positions of a confident beautician.

Duration: 15 hours

#### d.10 All about Lip Blush and Infralash Eyeliner

Description: This course covers everything you need to know about the lips and eyeliner PMU industry and will teach you how to implant pigments targeting specific areas to give an overall natural beauty finish. In the first section, you will learn all the fundamentals of enhancing natural lip color, how to improve and define the shape of the lips to give the illusion of fullness, and how the treatment enriches their color and vitality.

The second part of the course will cover how to select proper eyeliner pigments, depth, and pressure, and teach you everything you will need to attain amazing results and retention.

Live demonstrations and hands-on practice will teach you how to master the hand and body positions of a confident beautician.

Duration: 18 hours

#### d.11 Daily Nutrition

Description: More people are trying to lead a healthy lifestyle and are adopting healthier diets; however, the information available around nutrition can often be complex and confusing. Therefore, the aim of this course is to discover the scientific basics of a healthy diet and explore nutrition concepts and controversies. You will learn how to apply nutrition knowledge to personal food choices and how to evaluate nutrition information advertised on various media.

Duration: 15 hours

#### d.12 Sports Nutrition

Description: It is well known that high energy levels, optimal gains from training, improved general health, and accelerated recovery are all benefits associated with adequate nutritional practices. In this course, you will explore the impact of nutrition on an athlete's training. You will learn the best tips and insights on how to control your own nutrition and integrate proven strategies in your daily routine.

Duration: 15 hours

#### d.13 Infant Nutrition for a Better Growth

Description: Eating patterns that begin in childhood affect health and well-being across the lifespan. The culture of eating has changed significantly in recent decades, especially in parts of the world where processed foods dominate our dietary intake. This course examines current child nutrition and the impact of the individual decisions made by each family. Participants will learn what constitutes a healthy diet for children at different stages of growth and how to prepare easy, delicious foods, encouraging a long-term adaptation of easy home-cooked meals.

Duration: 15 hours

#### d.14 Fundamentals of Human Nutrition

Description: This three-credit undergraduate course introduces the basic concepts related to nutrition, providing an overview of nutrients, their food sources, digestion, metabolism, functions, and requirements in humans. This course also examines the use of dietary guidelines and recommendations to assess the nutrient intake of healthy individuals. Upon completion of the course, learners will be able to make optimal food choices for better health.

Duration: 45 hours

#### d.15 Advanced Food Service Management

Description: This advanced course on food management complements undergraduate training and encompasses all the management notions needed to run food establishments (hotels, restaurants, diet centers, etc.) efficiently. This course details managerial and operational concepts that are essential to food service management, i.e., marketing, finance, human resources, and leadership.

Duration: 45 hours

#### d.16 Pratiques pédagogiques et identité professionnelle des enseignants en intégration ou inclusion scolaire

Description : Cette formation présente des questions actuelles en matière d'intégration et d'inclusion scolaire. S'adressant aux responsables, enseignants, éducateurs, parents et étudiants, elle renvoie à l'intégration ou à l'inclusion des élèves à besoins éducatifs particuliers au sein des classes ordinaires et traite des stratégies permettant de soutenir ces élèves dans le quotidien de la classe. Outre les solutions favorisant l'apprentissage et le progrès chez les élèves présentant des besoins particuliers, la formation aborde également de nombreux thèmes, tels que les conditions de réussite des élèves, les transformations scolaires, la mise en commun des expertises, le soutien à l'innovation, l'évolution des pratiques professionnelles, les orientations didactiques, les compétences professionnelles et les expériences d'enseignement-apprentissage.

Durée : 40 heures

#### d.17 Soapmaking for Beginners

Description: The course will give you all the essential information about oils, butters, and fragrances, so that you can easily create your own bar soap recipes. With the knowledge you get from this course, you will no longer be limited to following other people's recipes, as you will be able to create your own unique handcrafted soaps and learn to color them using natural and cosmetic colors. The course will also show you a color swirling technique, as well as how to make shampoo, shaving, and exfoliating soap.

Duration: 15 hours

#### d.18 Science in the Kitchen

Description: Since kitchens make a great laboratory, this course aims to present scientific facts that occur in any kitchen and to discover how scientific knowledge can improve cooking and lead to a healthier behavior. Activities will aim to enhance the understanding of the science underlying food and cooking, highlighting how science can help to create eco-friendly, healthier, and sleeker kitchens.

Duration: 30 hours

#### d.19 The Art of Journalism and Media

Description: Designed for those with a passion for the traditional media, this course will teach you how to read the news accurately and clearly and present live bulletins to the public in an engaging way.

Duration: 15 hours

#### d.20 Broadcast Station Management

Description: This course provides advanced material for learners and practitioners in the radio/TV industry. Focusing on international processes and strategies, it helps participants stay prepared for their toughest tests in the production and creative television world.

Duration: 23 hours

## E. LAW AND POLITICAL SCIENCES

#### e.1 The Constitution and the Political System in Lebanon

Description: This course details the history of Lebanese institutions and the main sources of the Lebanese Constitution. It also includes a detailed study of the public state powers, their functions, and their interrelationships.

Duration: 15 hours

#### e.2 The New Great Game of Geopolitical Competition between Major Powers in the Middle East

Description: Get involved in Lebanese and international political and diplomatic processes in the Middle East with this online course, offered jointly with the Higher Institute of Political and Administrative Sciences (ISSPA) and specifically targeted at future political leaders, representatives, envoys, ambassadors, and consuls.

This distance learning geopolitics course will give you exposure to the geopolitical dynamics of the Middle East in general, and Lebanon in particular, also explaining how Lebanon has become a crucial geostrategic item on the agendas of the U.S. and the European Union. The tailored training, delivered in English in line with the needs of the current labor market, will help expand your knowledge of the Middle East, understand the main geopolitical factors that shape regional politics and the role of major powers in the region, learn new techniques in the field, and develop your skills in negotiation, decision-making, and consultation.

Duration: 30 hours

#### e.3 Geopolitics of the Middle East after COVID-19

Description: By all accounts, the COVID-19 pandemic has exposed how certain risk factors have jeopardized the viability of leading countries and further increased conflict dynamics among many nations. Given the continuing high level of militarization in the Middle East, the impact(s) of the pandemic will most likely leave sequels worth assessing. This online course aims to reflect on the possible impacts of COVID-19 in relation to the main geopolitical dynamics at the regional level, with a view to answering the following questions:

What are the possible scenarios for the region after the pandemic? What are the main political challenges and risks that the Middle East will face in the coming months? Will populism and armed conflicts within the current regional security complex be reinforced? Will geopolitical competition between Saudi Arabia and Iran lead to a new regional war? What type of geostrategies will small or less powerful countries like Lebanon, Syria, and Palestine implement in the current geopolitical dynamics? How will the COVID-19 outbreak affect Euro-Mediterranean relations?

Duration: 30 hours

#### e.4 The Legacy of the Arab Spring: Towards Inclusive Governance

Description: Addressing key political and legal issues in the Middle East today, this course introduces learners to the current Middle East by tapping into a diversity of disciplinary perceptions, including history, law, political science, and studies on religion, gender, mass media, sexuality, human rights, and urban life. It will emphasize the main tendencies and movements in modern Arab World history while analyzing both groundwork (basics) in Middle Eastern research and a common sense of modern directions and tracks in the field. As part of assessing the legacy of the Arab Spring and promoting the legal and political reforms needed to achieve inclusive governance, it examines regional peoples, traditions, society, and politics as well as the role of religion, gender, and culture in designing and influencing contemporary issues.

The course further delves into the main dynamics of international relations and the role of non-state actors in the Middle East, tackling the fundamental internal and external stakeholders in the region, peace and conflict (Israel/Palestine), the geostrategic significance of the region, political economy issues, political transformation and development, the problem of identities (characters)

in the Middle East and the related legal philosophies, and the politics of religion (including the emergence and challenges of political Islam, 9/11, the regional fallout of the US-led “war on terror”, and the Arab Spring).

Duration: 20 hours

#### e.5 The Lebanese Question (1920-1991)

Description: The contemporary history of Lebanon is marked by the country’s fierce struggle to maintain its territorial integrity and independence. As the first political entity established in the Middle East with institutional roots going back to the Middle Ages, Lebanon forged its own personality under the Mutasarrifiyya regime. This was confirmed with the establishment of the Republic of Lebanon (1926) and the Independence (1943).

Following its independence, Lebanon experienced periods of relative stability and prosperity based on an unwritten “National Pact”. Among the numerous states built on the remains of the Ottoman Empire in the Middle East, Lebanon is still struggling to forge its own identity free from regional and Western dominations in the wake of the two World Wars and the Cold War. This course tackles several critical topics to provide a thorough understanding of the historical factors currently shaping and influencing events and the future of Lebanon and the region.

Duration: 15 hours

## F. ENGINEERING

### f.1 Process of Innovating Healthcare Technologies

Description: Technology has always played a key role in healthcare innovations, leading to numerous discoveries designed to improve life expectancy and quality of life.

Medical software and devices are crucial to diagnosing, preventing, monitoring, and even treating illness and overcoming disabilities. The objective of this course is to provide a comprehensive roadmap for identifying, inventing, and implementing new health tech innovations.

Duration: 30 hours

### f.2 Product Management

Description: The goal of every company is to make money by creating value for customers. The responsibility of a product manager is to make sure the company is doing so by creating new products, improving satisfaction with existing products, and introducing the necessary amendments to them. Product management is the intersection between what customers want and that engineers can actually develop. Standing at a crossroads between business, technology, and user experience, this intensive 9-week course will teach the required product management skills. It is designed specifically for professionals with strong technical or business backgrounds who want to transition into product management roles in technology-based companies.

Duration: 45 hours

### f.3 Poultry Farming Techniques

Description: This course highlights the principles of poultry production and focuses on the best poultry farming practices, as well as on the establishment and management of hatcheries and farms. Topics covered include broilers, breeders, and layers production from an economical, management, nutritional, health, and biosecurity standpoint.

Duration: 45 hours

### f.4 Traditional Lebanese Mouneh Heritage: A Tool Towards Sustainability

Description: *Mouneh* is the traditional Lebanese pantry and is the object of renewed interest as it offers healthy and tasty options for consumers and low environmental impacts related to its production. The course aims to introduce the *mouneh* heritage, to share the best production methods, and to shed light on innovations in this field. It delivers recipes, science-based methods and techniques, as well as information on the nutritional aspects, best

preservation methods, and innovative examples combining *mouneh* with modernity. By the end of the course, learners will be able to produce high quality *mouneh* products with sustainability and creativity.

Duration: 15 hours

#### f.5 Introduction to Artificial Intelligence

Description: This course introduces basic concepts of Artificial Intelligence, working with data (preparing, analyzing, and presenting), as well as preliminaries in machine learning, deep learning, computer vision, and Natural Language Processing. It includes hands-on examples with different applications, using Python3 along with the corresponding libraries. As prerequisite, participants only need to have basic knowledge in programming (any language).

Duration: 15 hours

### G. LIFESTYLE

#### g.1 Life Skills

Description: Life skills improve our personal development and increase our awareness and identity, as they help develop talents and enhance our quality of life and self-confidence. Personal development enables us to achieve our full potential and enjoy a happier life and state of mind. These methods, tools, and techniques will allow for initiating inner change and growing in confidence.

H. Duration: 15 hours

#### g.2 Master your Emotions

Description: How can you handle your emotions and overcome hard times? Presenting each life incident from a broader perspective, the sessions of this course will be a journey of reflecting on our challenges and our response to them.
